

## +5V Powered RS-232 Transmitters/Receivers with 0.1 Microfarad External Capacitors

August 1997

### Features

- Meets All RS-232E and V.28 Specifications
- HIN203 and HIN205 Require No External Capacitors
- Requires Only 0.1 $\mu$ F or Greater External Capacitors
- 120kbit/s Data Rate
- Two Receivers Active in Shutdown Mode (HIN213)
- Requires Only Single +5V Power Supply
  - (+5V and +12V - HIN201 and HIN209)
- Onboard Voltage Doubler/Inverter
- Low Power Consumption (Typ) ..... 5mA
- Low Power Shutdown Function (Typ) ..... 1 $\mu$ A
- Three-State TTL/CMOS Receiver Outputs
- Multiple Drivers
  - $\pm$ 10V Output Swing for +5V Input
  - 300 $\Omega$  Power-Off Source Impedance
  - Output Current Limiting
  - TTL/CMOS Compatible
  - 30V/ $\mu$ s Maximum Slew Rate
- Multiple Receivers
  - $\pm$ 30V Input Voltage Range
  - 3k $\Omega$  to 7k $\Omega$  Input Impedance
  - 0.5V Hysteresis to Improve Noise Rejection

### Description

The HIN200-HIN213 family of RS-232 transmitters/receivers interface circuits meet all EIA RS-232E and V.28 specifications, and are particularly suited for those applications where  $\pm$ 12V is not available. They require a single +5V power supply (except HIN201 and HIN209) and feature onboard charge pump voltage converters which generate +10V and -10V supplies from the 5V supply. The HIN203 and HIN205 require no external capacitors and are ideally suited for applications where circuit board space is critical. The family of devices offers a wide variety of RS-232 transmitter/receiver combinations to accommodate various applications (see Selection Table).

The HIN200, HIN206, HIN211 and HIN213 feature a low power shutdown mode to conserve energy in battery powered applications. In addition, the HIN213 provides two active receivers in shutdown mode allowing for easy "wake-up" capability.

The drivers feature true TTL/CMOS input compatibility, slew rate-limited output, and 300 $\Omega$  power-off source impedance. The receivers can handle up to  $\pm$ 30V input, and have a 3k $\Omega$  to 7k $\Omega$  input impedance. The receivers also feature hysteresis to greatly improve noise rejection.

### Applications

- Any System Requiring RS-232 Communications Port
  - Computer - Portable, Mainframe, Laptop
  - Peripheral - Printers and Terminals
  - Instrumentation
  - Modems

### Selection Table

PART NUMBER	POWER SUPPLY VOLTAGE	NUMBER OF RS-232 DRIVERS	NUMBER OF RS-232 RECEIVERS	NUMBER OF 0.1 $\mu$ F EXTERNAL CAPACITORS	LOW POWER SHUTDOWN/TTL THREE-STATE	NUMBER OF RECEIVERS ACTIVE IN SHUTDOWN
HIN200	+5V	5	0	4 Capacitors	Yes/No	0
HIN201	+5V and +9V to 13.2V	2	2	2 Capacitors	No/No	0
HIN202	+5V	2	2	4 Capacitors	No/No	0
HIN203	+5V	2	2	None	No/No	0
HIN204	+5V	4	0	4 Capacitors	No/No	0
HIN205	+5V	5	5	None	Yes/Yes	0
HIN206	+5V	4	3	4 Capacitors	Yes/Yes	0
HIN207	+5V	5	3	4 Capacitors	No/No	0
HIN208	5V	4	4	4 Capacitors	No/No	0
HIN209	+5V and +9V to 13.2V	3	5	2 Capacitors	No/Yes	0
HIN211	+5V	4	5	4 Capacitors	Yes/Yes	0
HIN213	+5V	4	5	4 Capacitors	Yes/Yes	2

### Pin Descriptions

PIN	FUNCTION
V <sub>CC</sub>	Power Supply Input 5V ±10%, 5V ±5% (HIN200, HIN207, HIN203, and HIN205).
V+	Internally generated positive supply (+10V nominal), HIN201 and HIN209 requires +9V to +13.2V.
V-	Internally generated negative supply (-10V nominal).
GND	Ground lead. Connect to 0V.
C1+	External capacitor (+ terminal) is connected to this lead.
C1-	External capacitor (- terminal) is connected to this lead.
C2+	External capacitor (+ terminal) is connected to this lead.
C2-	External capacitor (- terminal) is connected to this lead.
T <sub>IN</sub>	Transmitter Inputs. These leads accept TTL/CMOS levels. An internal 400kΩ pull-up resistor to V <sub>CC</sub> is connected to each lead.
T <sub>OUT</sub>	Transmitter Outputs. These are RS-232 levels (nominally ±10V).
R <sub>IN</sub>	Receiver Inputs. These inputs accept RS-232 input levels. An internal 5kΩ pull-down resistor to GND is connected to each input.
R <sub>OUT</sub>	Receiver Outputs. These are TTL/CMOS levels.
$\overline{\text{EN}}$ , EN	Enable input. This is an active low input which enables the receiver outputs. With $\overline{\text{EN}} = 5\text{V}$ , (HIN213 EN = 0V), the outputs are placed in a high impedance state.
SD, $\overline{\text{SD}}$	Shutdown Input. With SD = 5V (HIN213 $\overline{\text{SD}} = 0\text{V}$ ), the charge pump is disabled, the receiver outputs are in a high impedance state (except R4 and R5 of HIN213) and the transmitters are shut off.
NC	No Connect. No connections are made to these leads.

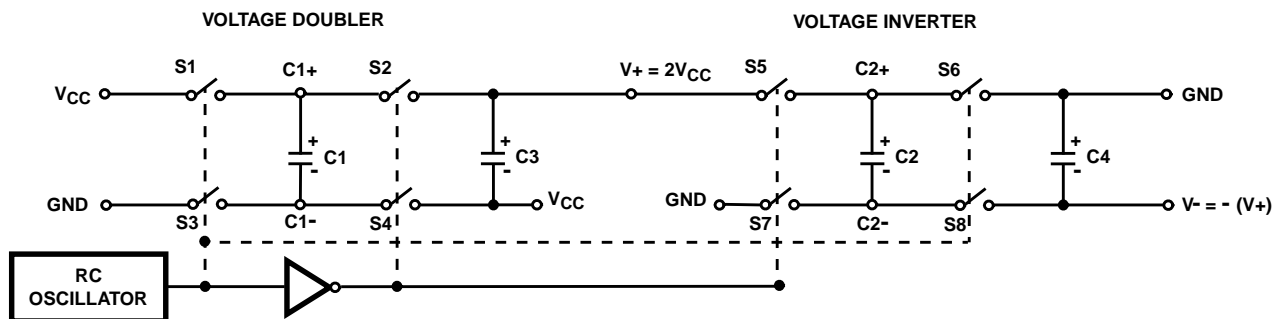

FIGURE 1. CHARGE PUMP

## HIN200 thru HIN213

### Detailed Description

The HIN200 thru HIN213 family of RS-232 transmitters/receivers are powered by a single +5V power supply (except HIN201 and HIN209), feature low power consumption, and meet all EIA RS232C and V.28 specifications. The circuit is divided into three sections: the charge pump, transmitter, and receiver.

#### Charge Pump

An equivalent circuit of the charge pump is illustrated in Figure 1. The charge pump contains two sections: the voltage doubler and the voltage inverter. Each section is driven by a two phase, internally generated clock to generate +10V and -10V. The nominal clock frequency is 125kHz. During phase one of the clock, capacitor C1 is charged to  $V_{CC}$ . During phase two, the voltage on C1 is added to  $V_{CC}$ , producing a signal across C3 equal to twice  $V_{CC}$ . During phase two, C2 is also charged to  $2V_{CC}$ , and then during phase one, it is inverted with respect to ground to produce a signal across C4 equal to  $-2V_{CC}$ . The charge pump accepts input voltages up to 5.5V. The output impedance of the voltage doubler section (V+) is approximately  $200\Omega$ , and the output impedance of the voltage inverter section (V-) is approximately  $450\Omega$ . A typical application uses  $0.1\mu\text{F}$  capacitors for C1-C4, however, the value is not critical. Increasing the values of C1 and C2 will lower the output impedance of the voltage doubler and inverter, increasing the values of the reservoir capacitors, C3 and C4, lowers the ripple on the V+ and V- supplies.

During shutdown mode (HIN200, HIN206 and HIN211,  $\overline{\text{SD}} = V_{CC}$ , HIN213,  $\overline{\text{SD}} = 0\text{V}$ ) the charge pump is turned off, V+ is pulled down to  $V_{CC}$ , V- is pulled up to GND, and the supply current is reduced to less than  $10\mu\text{A}$ . The transmitter outputs are disabled and the receiver outputs (except for HIN213, R4 and R5) are placed in the high impedance state.

#### Transmitters

The transmitters are TTL/CMOS compatible inverters which translate the inputs to RS-232 outputs. The input logic threshold is about 26% of  $V_{CC}$ , or 1.3V for  $V_{CC} = 5\text{V}$ . A logic 1 at the input results in a voltage of between -5V and V- at the output, and a logic 0 results in a voltage between +5V and (V+ - 0.6V). Each transmitter input has an internal  $400\text{k}\Omega$  pullup resistor so any unused input can be left unconnected and its output remains in its low state. The output voltage swing meets the RS-232C specifications of  $\pm 5\text{V}$  minimum with the worst case conditions of: all transmitters driving  $3\text{k}\Omega$  minimum load impedance,  $V_{CC} = 4.5\text{V}$ , and maximum allowable operating temperature. The transmitters have an internally limited output slew rate which is less than  $30\text{V}/\mu\text{s}$ . The outputs are short circuit protected and can be shorted to ground indefinitely. The powered down output impedance is a minimum of  $300\Omega$  with  $\pm 2\text{V}$  applied to the outputs and  $V_{CC} = 0\text{V}$ .

#### Receivers

The receiver inputs accept up to  $\pm 30\text{V}$  while presenting the required  $3\text{k}\Omega$  to  $7\text{k}\Omega$  input impedance even if the power is off ( $V_{CC} = 0\text{V}$ ). The receivers have a typical input threshold of 1.3V which is within the  $\pm 3\text{V}$  limits, known as the transition region, of the RS-232 specifications. The receiver output is

0V to  $V_{CC}$ . The output will be low whenever the input is greater than 2.4V and high whenever the input is floating or driven between +0.8V and -30V. The receivers feature 0.5V hysteresis (except during shutdown) to improve noise rejection. The receiver Enable line ( $\overline{\text{EN}}$ , on HIN206, HIN209, and HIN211, EN on HIN213) when unasserted, disables the receiver outputs, placing them in the high impedance mode. The receiver outputs are also placed in the high impedance state when in shutdown mode (except HIN213 R4 and R5).

FIGURE 2. TRANSMITTER

FIGURE 3. RECEIVER

$$\text{AVERAGE PROPAGATION DELAY} = \frac{t_{\text{PHL}} + t_{\text{PLH}}}{2}$$

FIGURE 4. PROPAGATION DELAY DEFINITION

### HIN213 Operation in Shutdown

The HIN213 features two receivers, R4 and R5, which remain active in shutdown mode. During normal operation the receivers propagation delay is typically  $0.5\mu\text{s}$ . This propagation delay may increase slightly during shutdown. When entering shut down mode, receivers R4 and R5 are not valid for  $80\mu\text{s}$  after  $\overline{\text{SD}} = V_{\text{IL}}$ . When exiting shutdown mode, all receiver outputs will be invalid until the charge pump circuitry reaches normal operating voltage. This is typically less than 2ms when using  $0.1\mu\text{F}$  capacitors.

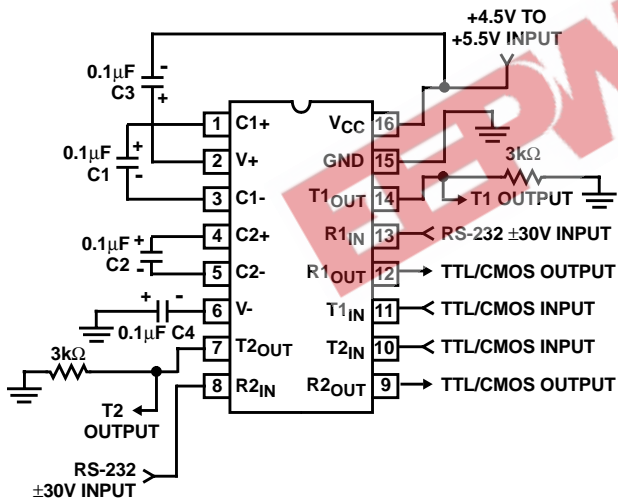

FIGURE 7. GENERAL TEST CIRCUIT

FIGURE 8. POWER-OFF SOURCE RESISTANCE CONFIGURATION

## HIN200 thru HIN213

### Application Information

The HINXXX may be used for all RS-232 data terminal and communication links. It is particularly useful in applications where  $\pm 12V$  power supplies are not available for conventional RS-232 interface circuits. The applications presented represent typical interface configurations.

A simple duplex RS-232 port with CTS/RTS handshaking is illustrated in Figure 9. Fixed output signals such as DTR (data terminal ready) and DSRS (data signaling rate select) is generated by driving them through a  $5k\Omega$  resistor connected to  $V+$ .

In applications requiring four RS-232 inputs and outputs (Figure 10), note that each circuit requires two charge pump capacitors ( $C1$  and  $C2$ ) but can share common reservoir capacitors ( $C3$  and  $C4$ ). The benefit of sharing common reservoir capacitors is the elimination of two capacitors and the reduction of the charge pump source impedance which effectively increases the output swing of the transmitters.
