STK400-490**3ch AF Power Amplifier (Split Power Supply)
25W + 50W + 25W, THD = 0.4%****Overview**

The STK400-490 is an audio power amplifier IC for multi-channel speaker applications. It comprises two 25W channels (left and right) and a 50W channel (center) in a single package. It is fully pin compatible with the 3-channel output devices (STK400-x00 series) and 2-channel output devices (STK401-x00 series). In addition, it supports 6/3Ω output load impedance.

Features

- Pin compatible with the 3-channel output devices (STK400-x00 series) and 2-channel output devices (STK401-x00 series)
- Output load impedance $R_L = 6/3\Omega$ supported
- Pin configuration grouped into individual blocks of inputs, outputs and supply lines to minimize the adverse effects of pattern layout on operating characteristics.
- Few external components

Package Dimensions

unit: mm

4086A

**Specifications**Maximum Ratings at $T_a = 25^\circ\text{C}$

| Parameter | Channel | Symbol | Conditions | Ratings | Unit |
|---------------------------------------|---------|--------------------------|---|-------------|--------------------|
| Maximum supply voltage | L, R | $V_{CC \text{ max (1)}}$ | | ± 36 | V |
| | C | $V_{CC \text{ max (2)}}$ | | ± 47 | V |
| Thermal resistance | L, R | $\theta_{j-c (1)}$ | Per power transistor | 2.1 | $^\circ\text{C/W}$ |
| | C | $\theta_{j-c (2)}$ | Per power transistor | 1.7 | $^\circ\text{C/W}$ |
| Junction temperature | | T_j | | 150 | $^\circ\text{C}$ |
| Operating substrate temperature | | T_c | | 125 | $^\circ\text{C}$ |
| Storage temperature | | T_{stg} | | -30 to +125 | $^\circ\text{C}$ |
| Available time for load short-circuit | L, R | $t_s (1)$ | $V_{CC} = \pm 25\text{V}, R_L = 6\Omega, f = 50\text{Hz}, P_O = 25\text{W}$ | 1 | s |
| | C | $t_s (2)$ | $V_{CC} = \pm 32\text{V}, R_L = 6\Omega, f = 50\text{Hz}, P_O = 50\text{W}$ | 1 | s |

Operating Characteristics at $T_a = 25^\circ\text{C}$, $R_L = 6\Omega$ (noninductive load), $R_g = 600\Omega$, $V_G = 40\text{dB}$

| Parameter | Channel | Symbol | Conditions | min | typ | max | Unit |
|---------------------------|---------|---------------|--|-----|-----------|-----|-----------|
| Output power | L, R | $P_O(1)$ | $V_{CC} = \pm 25\text{V}$, $f = 20\text{Hz}$ to 20kHz , $\text{THD} = 0.4\%$ | 25 | 30 | - | W |
| | C | $P_O(2)$ | $V_{CC} = \pm 32\text{V}$, $f = 20\text{Hz}$ to 20kHz , $\text{THD} = 0.4\%$ | 50 | 55 | - | W |
| | L, R | $P_O(3)$ | $V_{CC} = \pm 21\text{V}$, $f = 1\text{kHz}$, $\text{THD} = 1.0\%$, $R_L = 3\Omega$ | 25 | 30 | - | W |
| | C | $P_O(4)$ | $V_{CC} = \pm 26\text{V}$, $f = 1\text{kHz}$, $\text{THD} = 1.0\%$, $R_L = 3\Omega$ | 50 | 55 | - | W |
| Total harmonic distortion | L, R | THD(1) | $V_{CC} = \pm 25\text{V}$, $f = 20\text{Hz}$ to 20kHz , $P_O = 1.0\text{W}$ | - | - | 0.4 | % |

| Neutral voltage | L, R | $V_N(1)$ | $V_{CC} = \pm 30\text{V}$ | -70 | 0 | +70 | mV |
| | C | $V_N(2)$ | $V_{CC} = \pm 39\text{V}$ | -70 | 0 | +70 | mV |

Notes.

All tests are measured using a constant-voltage supply unless otherwise specified.

Available time for load short-circuit and output noise voltage are measured using the transformer supply specified below.

The output noise voltage is the peak value of an average-reading meter with an rms value scale (VTVM). A regulated AC supply (50Hz) should be used to eliminate the effects of AC primary line flicker noise.

1. V_{CC} max1 (R_L = 6Ω), V_{CC} max2 (R_L = 3 to 6Ω), V_{CC}1 (R_L = 6Ω), V_{CC}2 (R_L = 3Ω)

Heatsink Design Considerations

The heatsink thermal resistance, θ_{c-a} , required to dissipate the STK400-490 device total power dissipation, P_d , is determined as follows:

Condition 1: IC substrate temperature not to exceed 125°C.

$$P_d(\text{total}) \times \theta_{c-a} + T_a < 125^\circ\text{C} \dots\dots\dots (1)$$

$$P_d(\text{total}) = P_d(L) + P_d(R) + P_d(C)$$

where T_a is the guaranteed maximum ambient temperature, $P_d(\text{total})$ is the total power dissipation, $P_d(L)$ is the left-channel power dissipation, $P_d(R)$ is the right-channel power dissipation and $P_d(C)$ is the center-channel power dissipation.

Condition 2: Power transistor junction temperature, T_j , not to exceed 150°C.

$$P_d(\text{total}) \times \theta_{c-a} + [P_d(L) + P_d(R)]/N \times \theta_{j-c} + T_a < 150^\circ\text{C} \dots\dots\dots (2)$$

$$P_d(\text{total}) \times \theta_{c-a} + P_d(C)/N' \times \theta_{j-c'} + T_a < 150^\circ\text{C} \dots\dots\dots (3)$$

where N is the left and right-channel number of power transistors, N' is the center-channel number of power transistors, θ_{j-c} is the left and right-channel power transistor thermal resistance per transistor, and $\theta_{j-c'}$ is the center-channel power transistor thermal resistance per transistor. Note that the power dissipated per transistor is the total, P_d , divided evenly among the N power transistors.

Expressions (1), (2) and (3) can be rewritten making θ_{c-a} the subject.

$$\theta_{c-a} < (125 - T_a)/P_d(\text{total}) \dots\dots\dots (1)'$$

$$\theta_{c-a} < (150 - T_a)/P_d(\text{total}) - [P_d(L) + P_d(R)] \times \theta_{j-c}/[P_d(\text{total}) \times N] \dots\dots\dots (2)'$$

$$\theta_{c-a} < (150 - T_a)/P_d(\text{total}) - P_d(C) \times \theta_{j-c'}/[P_d(\text{total}) \times N'] \dots\dots\dots (3)'$$

The heatsink required must have a thermal resistance that simultaneously satisfies all three expressions.

The heatsink thermal resistance can be determined from (1)', (2)' and (3)' once the following parameters have been defined.

- Supply voltage: V_{CC}
- Load resistance: R_L
- Guaranteed maximum ambient temperature: T_a

The total device power dissipation when STK400-490 $V_{CC(1)} = \pm 25V$, $V_{CC(2)} = \pm 32V$ and $R_L = 6\Omega$, for a continuous sine wave signal, is a maximum of 42.5W (left + right channels) and 34.3W (center channel), as shown in the "Pd — P_O " characteristics graphs.

When estimating the power dissipation for an actual audio signal input, the rule of thumb is to select P_d correspond-

ing to $(1/10) \times P_{O \text{ max}}$ (within safe limits) for a continuous sine wave input. For example,

$$P_d(L) + P_d(R) = 25W \text{ [for } (1/10) \times P_{O \text{ max}} = 2.5W]$$

$$P_d(C) = 21.6W \text{ [for } (1/10) \times P_{O \text{ max}} = 5W]$$

$$P_d(\text{total}) = P_d(L) + P_d(R) + P_d(C) = 46.6W$$

The STK400-490 has 4 left + right-channel power transistors (N), 2 center-channel power transistors (N'), left + right-channel thermal resistance per transistor (θ_{j-c}) is 2.1°C/W, and center-channel thermal resistance per transistor ($\theta_{j-c'}$) is 1.7°C/W. If the guaranteed maximum ambient temperature, T_a , is 50°C, then the required heatsink thermal resistance, θ_{c-a} , is:

From expression (1)':

$$\theta_{c-a} < (125 - 50)/46.6 < 1.60$$

From expression (2)':

$$\theta_{c-a} < (150 - 50)/46.6 - 25 \times 2.1/(46.6 \times 4) < 1.86$$

From expression (3)':

$$\theta_{c-a} < (150 - 50)/46.6 - 21.6 \times 1.7/(46.6 \times 2) < 1.75$$

Therefore, to satisfy all three expressions, the required heatsink must have a thermal resistance less than 1.6°C/W.

Similarly, when STK400-490 $V_{CC(1)} = \pm 21V$, $V_{CC(2)} = \pm 26V$ and $R_L = 3\Omega$,

$$P_d(L) + P_d(R) = 30W \text{ [for } (1/10) \times P_{O \text{ max}} = 2.5W]$$

$$P_d(C) = 25.5W \text{ [for } (1/10) \times P_{O \text{ max}} = 5W]$$

$$P_d(\text{total}) = P_d(L) + P_d(R) + P_d(C) = 55.5W$$

From expression (1)':

$$\theta_{c-a} < (125 - 50)/55.5 < 1.35$$

From expression (2)':

$$\theta_{c-a} < (150 - 50)/55.5 - 30 \times 2.1/(55.5 \times 4) < 1.51$$

From expression (3)':

$$\theta_{c-a} < (150 - 50)/55.5 - 25.5 \times 1.7/(55.5 \times 2) < 1.41$$

Therefore, to satisfy all three expressions, the required heatsink must have a thermal resistance less than 1.35°C/W.

This heatsink design example is based on a constant-voltage supply, and should be verified within your specific set environment.
