FEATURES for 74F723A/74F723-1

- Consists of four 3-to-1 Multiplexers
- High impedance PNP base inputs for reduced loading (20µA in High and Low states)
- Inverting or non-inverting data path capability by an inverting ($\overline{INV}$) input
- Designed for address multiplexing of dynamic RAM and other applications
- Multiple side pins for V_{CC} and GND to reduce lead inductance (improves speed and noise immunity)
- 3-State outputs sink 64mA (74F723A only)
- 30Ω termination impedance on each output – 74F723-1

FEATURES for 74F725A/74F725-1

- Consists of four 4-to-1 Multiplexers
- High impedance PNP base inputs for reduced loading (20µA in High and Low states)
- Equivalent to two 74F253s without 3-State
- Outputs sink 64mA (74F725A only)
- 30Ω termination impedance on each output – 74F725-1

DESCRIPTION

The 74F723A/74F723-1 consist of four 3-to-1 multiplexers designed for address multiplexing of dynamic RAMs and other multiplexing applications. Select (S0, S1) inputs control which line is to be selected, as defined in the Function Table for 74F723A/74F723-1. When the invering input ($\overline{INV}$) is Low, the input data path is inverted.

To improve speed and noise immunity, V_{CC} and GND side pins are used. The 3-State outputs source 15mA and sink 64mA. The 74F723-1 is the same as 74F723A except that it has a 30Ω temination impedance on each output to reduce line noise and the 3-State outputs sink 5mA.

The 74F725A/74F725-1 consist of four 4-to1 multiplexers designed for general multiplexing purpose. The select (S0, S1) inputs control which line is to be selected, as defined in the Function Table for 74F725A/725-1. The outputs source 15mA and sink 64mA. The 74F725-1 is the same as the 74F725A except that it has a 30Ω termination impedance on each output to reduce line noise and the outputs sink 5mA.

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
3. Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
4. I_O is tested under conditions that produce current approximity one half of the true short-circuit output current (I_{OS}).
