

## INTRODUCTION

The KC74129B is an interline transfer CCD area image sensor developed for CCIR 1/4 inch optical format video cameras, surveillance cameras, object detectors and image pattern recognizers. High sensitivity is on-chip micro lenses and HAD (Hole Accumulated Diode) photosensors. This chip features a field integration read out system and an electronic shutter with variable charge storage time.

14Pin Cer DIP

## FEATURES

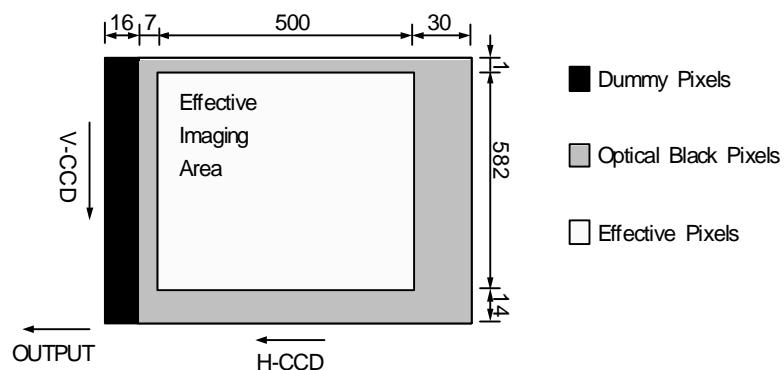

- High Sensitivity
- Optical Size 1/4 inch Format
- No Adjust Substrate Bias
- Variable Speed Electronic Shutter (1/60, 1/100 ~ 1/10,000sec)
- Low Dark Current
- Horizontal Register 3.3 to 5.0V Drive
- 14pin Ceramic DIP Package
- Field Integration Read Out System
- No DC Bias on Reset Gate

## ORDERING INFORMATION

Device	Package	Operating
KC74129B	14Pin Cer DIP	-10 °C ~ +60 °C

## STRUCTURE

- Number of Total Pixels: 537(H) × 597(V)
- Number of Effective Pixels: 500(H) × 582(V)
- Chip Size: 4.80mm(H) × 4.04mm(V)
- Unit Pixel Size: 7.30μm(H) × 4.70μm(V)
- Optical Blacks & Dummies: Refer to Figure Below  
Vertical 1 Line (Even Field Only)

## BLOCK DIAGRAM

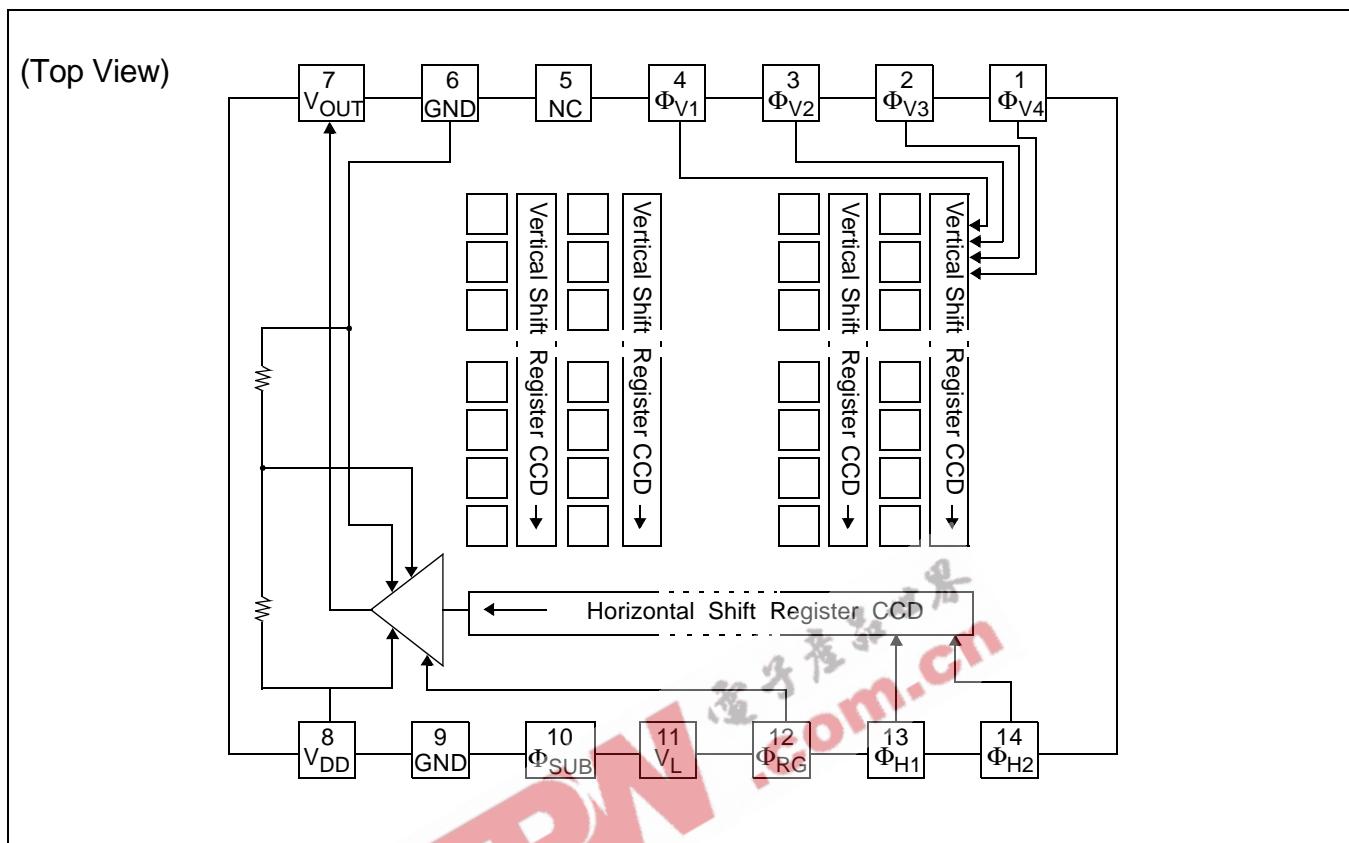

Figure 1. Block Diagram

## PIN DESCRIPTION

Table 1. Pin Description

Pin	Symbol	Description	Pin	Symbol	Description
1	$\Phi_{V4}$	Vertical register transfer clock	8	$V_{DD}$	Signal output
2	$\Phi_{V3}$	Vertical register transfer clock	9	GND	GND
3	$\Phi_{V2}$	Vertical register transfer clock	10	$\Phi_{SUB}$	Substrate clock
4	$\Phi_{V1}$	Vertical register transfer clock	11	$V_L$	Protection transistor bias
5	NC	No connection	12	$\Phi_{RG}$	Reset gate clock
6	GND	Ground	13	$\Phi_{H1}$	Horizontal register transfer clock
7	$V_{OUT}$	Signal output	14	$\Phi_{H2}$	Horizontal register transfer clock

**ABSOLUTE MAXIMUM RATINGS (NOTE)****Table 2. Absolute Maximum Ratings**

Characteristics	Symbols	Min.	Max.	Unit
Substrate voltage	SUB - GND	-0.3	40	V
	V <sub>DD</sub> , V <sub>OUT</sub> - SUB	-40	10	V
Vertical clock input voltage	Φ <sub>V1</sub> , Φ <sub>V3</sub> , - GND	-0.3	30	V
	Φ <sub>V2</sub> , Φ <sub>V4</sub> - GND	-0.3	17	V
	Φ <sub>V1</sub> , Φ <sub>V3</sub> , - V <sub>L</sub>	-0.3	30	V
	Φ <sub>V2</sub> , Φ <sub>V4</sub> - V <sub>L</sub>	-0.3	17	V
	Φ <sub>V1</sub> , Φ <sub>V2</sub> , Φ <sub>V3</sub> , Φ <sub>V4</sub> - SUB	-40	10	V
Horizontal clock input voltage	Φ <sub>H1</sub> , Φ <sub>H2</sub> - V <sub>L</sub>	-0.3	7	V
	Φ <sub>H1</sub> , Φ <sub>H2</sub> - SUB	-30	7	V
Voltage difference between vertical and horizontal clock input pins	Φ <sub>V1</sub> , Φ <sub>V2</sub> , Φ <sub>V3</sub> , Φ <sub>V4</sub>		15	V
	Φ <sub>H1</sub> , Φ <sub>H2</sub>		16	V
	Φ <sub>H1</sub> , Φ <sub>H2</sub> - Φ <sub>V4</sub>	-17	16	V
Output clock input voltage	Φ <sub>RG</sub> - GND	-0.3	16	V
	Φ <sub>RG</sub> - SUB	-40	16	V
Protection circuit bias voltage	V <sub>L</sub> - SUB	-40	10	V
Operating temperature	T <sub>OP</sub>	-10	60	°C
Storage temperature	T <sub>STG</sub>	-30	80	°C

**NOTE:** The device can be destroyed, if the applied voltage or temperature is higher than the absolute maximum rating voltage or temperature.

## DC CHARACTERISTICS

**Table 3. DC Characteristics**

Item	Symbol	Min.	Typ.	Max.	Unit
Output stage drain bias	$V_{DD}$	14.55	15.0	15.45	V
Protection circuit bias voltage	$V_L$	The lowest vertical clock level			
Output stage drain current	$I_{DD}$		5		mA

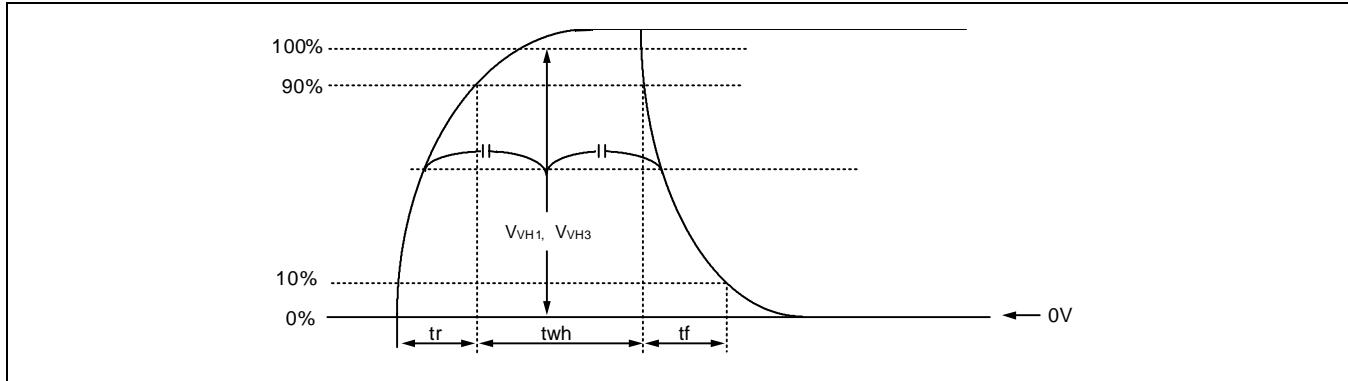

## CLOCK VOLTAGE CONDITIONS

**Table 4. Clock Voltage Conditions**

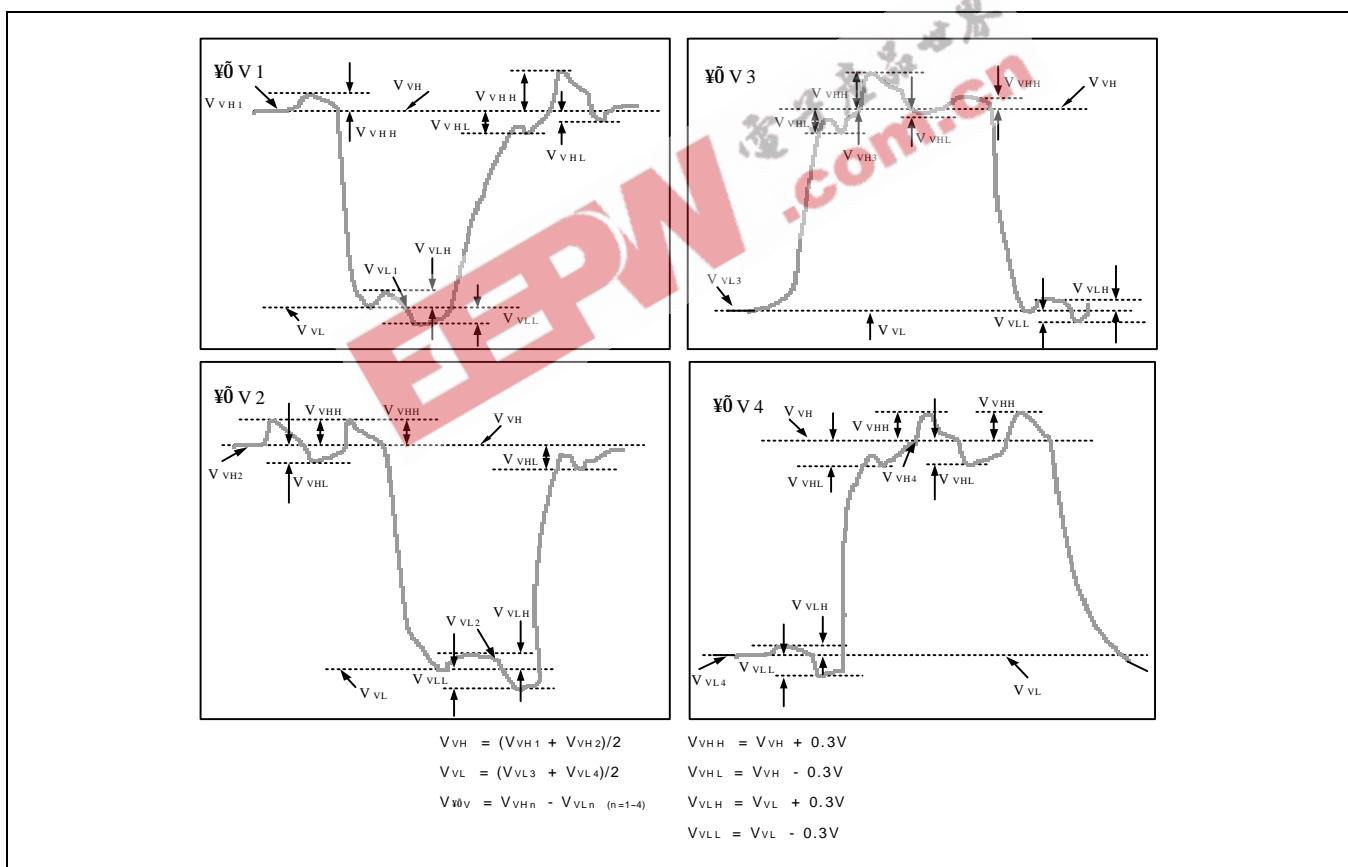

Item	Symbol	Min.	Typ.	Max.	Unit	Remark
Read-out clock voltage	$V_{VH1}, V_{VH3}$	14.55	15.0	15.45	V	High level
Vertical transfer clock voltage	$V_{VM1} \sim V_{VM4}$	-0.2	0.0	0.2	V	Middle
	$V_{VL1} \sim V_{VL4}$	-8.0	-7.5	-7.0	V	Low
Horizontal transfer clock voltage	$V_{HH1}, V_{HH2}$	3.0	5.0	5.25	V	High
	$V_{HL1}, V_{HL2}$	-0.05	0.0	0.05	V	Low
Charge reset clock voltage	$V_{RGH}$	4.75	5.0	5.25	V	High
	$V_{RGL}$	-0.2	0.0	0.2	V	Low
Substrate clock voltage	$V_{\Phi SUB}$	21.5	22.5	23.5	V	Shutter

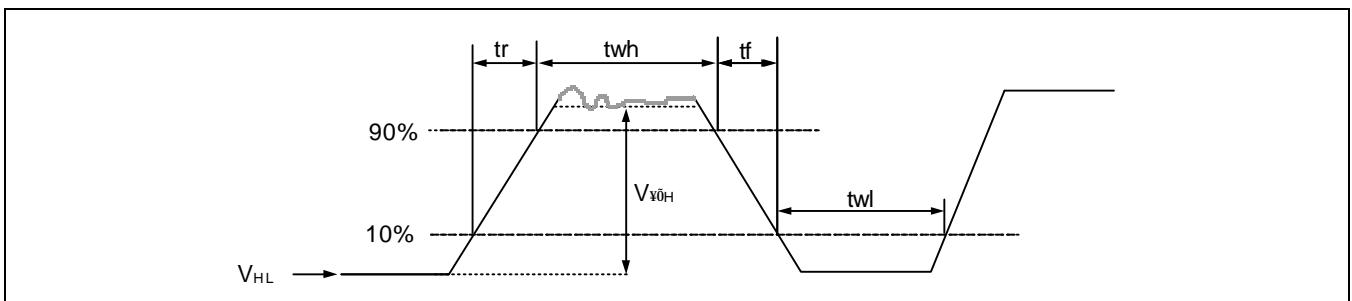

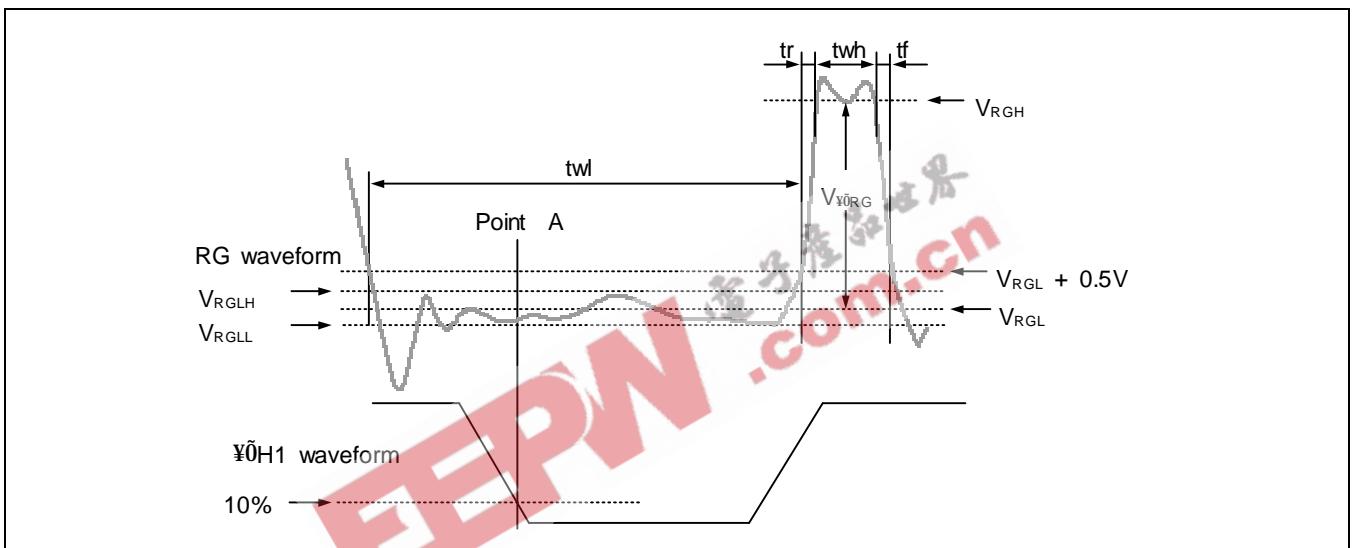

## DRIVE CLOCK WAVEFORM CONDITIONS

### Read Out Clock Waveform

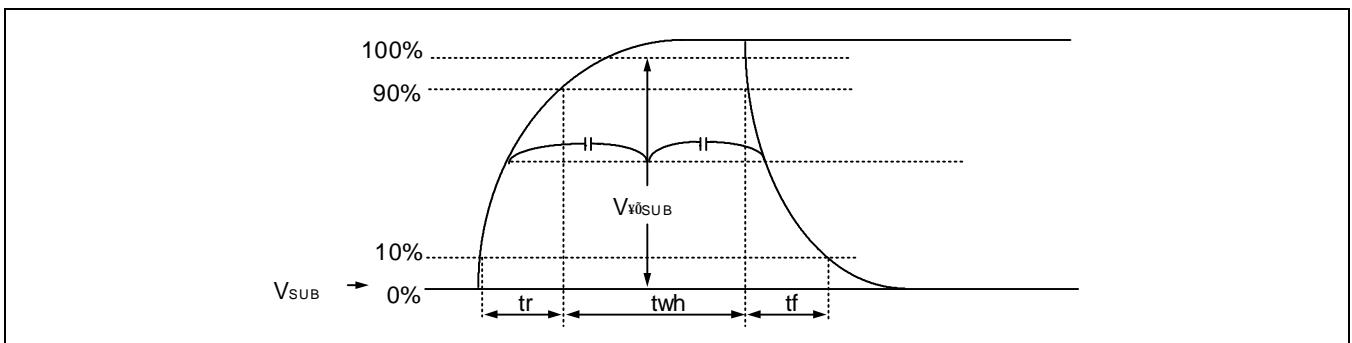

### Vertical Transfer Clock Waveform

**Horizontal Transfer Clock Waveform Diagram****Reset Gate Clock Waveform Diagram**

$V_{RGLH}$  is the maximum value and  $V_{RGLL}$  the minimum value of the coupling waveform in the period from Point A in the diagram about to  $R_G$  rise

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2, V_{FRG} = V_{RGH} - V_{RGL}$$

**Substrate Clock Waveform**

**CLOCK EQUIVALENT CIRCUIT CONSTANT****Table 5. Clock Equivalent Circuit Constant**

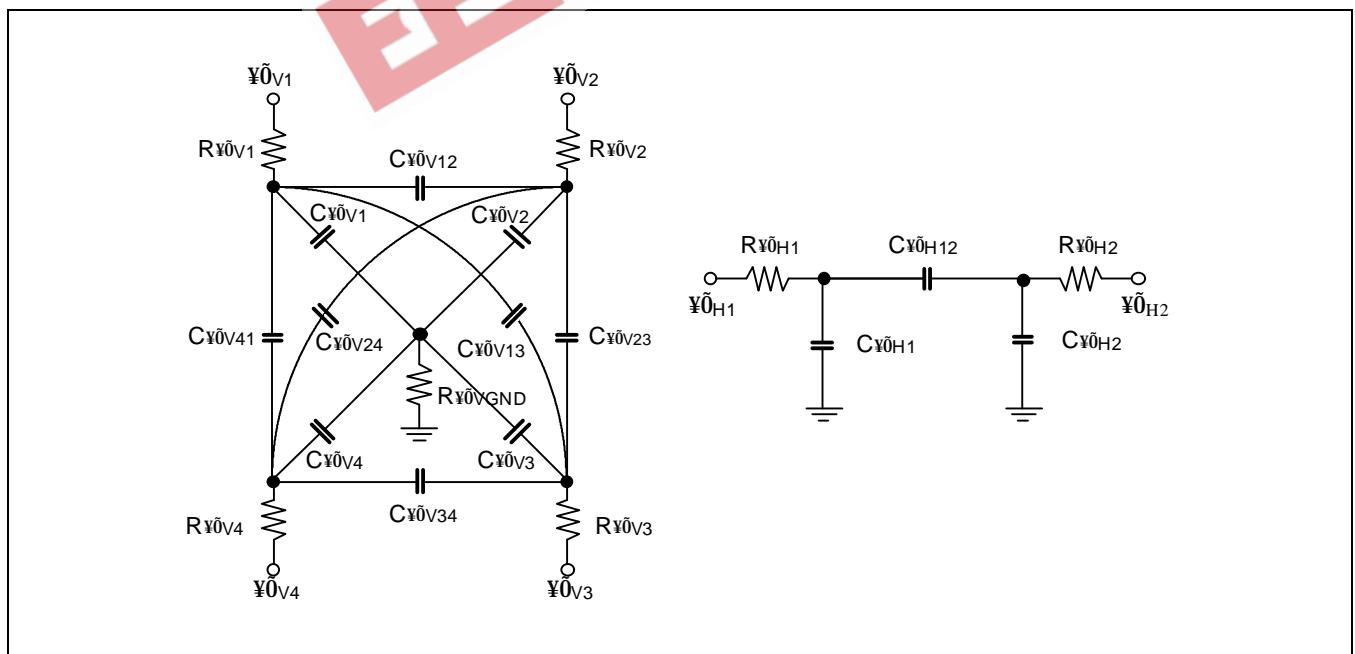

Item	Symbol	twh			twl			tr			tf			Unit
		Min.	Typ.	Max.										
Read-out clock	$\Phi_{VH}$		2.5						0.5			0.5		μs
Vertical clock	$\Phi_{V1}, \Phi_{V2}$ $\Phi_{V3}, \Phi_{V4}$										15		250	ns
Horizontal clock	$\Phi_{H1}$	41	46		41	46			6.5	9.5		6.5	9.5	ns
	$\Phi_{H2}$	41	46		41	46			6.5	9.5		6.5	9.5	ns
Reset clock	$\Phi_{RG}$	11	14		76	80			6.0			5.0		ns
Substrate clock	$\Phi_{SUB}$	1.5	2.0							0.5			0.5	μs

## EQUIVALENT CIRCUIT PARAMETERS

Table 6. Equivalent Circuit Parameters

Item	Symbol	Typ.	Unit	Remark
Capacitance between vertical transfer clock and GND	$C_{\Phi V1}, C_{\Phi V3}$	680	pF	
	$C_{\Phi V2}, C_{\Phi V4}$	820	pF	
Capacitance between vertical transfer clocks	$C_{\Phi V12}, C_{\Phi V34}$	180	pF	
	$C_{\Phi V23}, C_{\Phi V41}$	180	pF	
	$C_{\Phi V13}$	60	pF	
	$C_{\Phi V24}$	60	pF	
Capacitance between horizontal transfer clock and GND	$C_{\Phi H1}, C_{\Phi H2}$	30	pF	
Capacitance between horizontal transfer clocks	$C_{\Phi H12}$	30	pF	
Capacitance between substrate clock and GND	$C_{\Phi SUB}$	180	pF	
Vertical transfer clock serial resistor	$R_{\Phi V1} \sim R_{\Phi V4}$	40	$\Omega$	
Vertical transfer clock ground resistor	$R_{\Phi VGND}$	15	$\Omega$	
Horizontal transfer clock serial resistor	$R_{\Phi H1}, R_{\Phi H2}$	10	$\Omega$	
Reset gate clock serial resistor	$R_{\Phi RG}$	100	$\Omega$	

## OPERATING CHARACTERISTICS

Device Temperature = 25 °C

**Table 7. Operating Characteristics**

Item	Symbol	Min.	Typ.	Max.	Unit	Remark
Sensitivity	S	85	95		mV/lux	1
Saturation signal	Y <sub>SAT</sub>	800			mV	2
Smear	SM		0.007	0.01	%	3
Blooming margin	BM	1,000			times	4
Uniformity	U			20	%	5
Dark signal (NOTE)	D			2	mV	6
Dark shading (NOTE)	ΔD			2	mV	7
Image lag	Y <sub>LAG</sub>			0.5	%	8
Flicker Y	F <sub>Y</sub>			2	%	9

**NOTE:** Test Temperature = 60 °C

## TEST CONDITION

1. Use a light source with color temperature of 3,200K halogen lamp and CM-500S for IR cut filter.  
The light source is adjusted in accordance with the average value of Y signals indicated in each item.

## TEST METHODS

1. Measure the light intensities ( $L$ ) when the averaged illuminance output value ( $Y$ ) is the standard illuminance output value, 150mV ( $Y_A$ ) and when half of 150mV ( $1/2 Y_A$ ).

$$S = \frac{Y_A - \frac{1}{2}Y_A}{L_{YA} - L_{\frac{1}{2}Y_A}}$$

2. Adjust the light intensity to 15 times of the value with which  $Y$  is  $Y_A$ , then measure the averaged illuminance output value ( $Y = Y_{SAT}$ ).

3. Adjust the light intensity to 500 times of the value with which  $Y$  is  $Y_A$ , then remove the read-out clock and drain the signal in photosensors by the electronic shutter operation in all the respective horizontal blanking times with the other clocks unchanged. Measure the maximum illuminance output value ( $Y_{SM}$ ).

$$SM = \frac{Y_{SM}}{Y_A} \times \frac{1}{500} \times \frac{1}{10} \times 100(%)$$

4. Adjust the light intensity to 1,000 times of the value with which  $Y$  is  $Y_A$ , then inspect whether there is blooming phenomenon or not.

5. Measure the maximum and minimum illuminance output value ( $Y_{MAX}$ ,  $Y_{MIN}$ ) when the light intensity is adjusted to make  $Y$  to be  $Y_A$ .

$$U = \frac{Y_{MAX} - Y_{MIN}}{Y_A} \times 100(%)$$

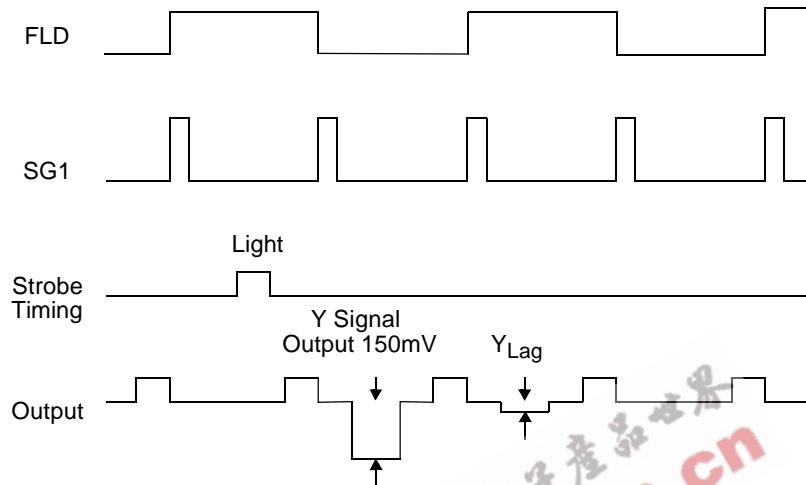

6. Measure  $Y_D$  with the horizontal idling time transfer level as reference, when the device ambient temperature is 60 °C and all of the light sources are shielded.

7. Follow test method 6, measure the maximum ( $D_{MAX}$ ) and minimum illuminance output ( $D_{MIN}$ ).

$$\Delta D = D_{MAX} - D_{MIN}$$

8. Adjust the light intensity of Y signal output value by strobe light to 150mV ( $Y_A$ ), calculate by below formula with measuring the image lag signal which is generated by below timing diagram.

$$Y_{LAG} = (Y_{lag}/150) \times 100(\%)$$

9. Adjust the light intensity of Y signal average value to 150mV ( $Y_A$ ), calculate by below formula with measuring the signal differences ( $\Delta Y_f$  [mV]) between fields.

$$F_Y = (\Delta Y_f / Y_A) \times 100(\%)$$

## HANDLING INSTRUCTIONS

- Static Charge Prevention

CCD image sensors can be easily damaged by static discharge. Before handling, be sure to take the following protective measures.

- Use non chargeable gloves, clothes or material. Also use conductive shoes.
- When handling directly, use an earth band.
- Install a conductive mat on the floor or working table to prevent generation of static electricity.
- Ionized air is recommended for discharging when handling CCD image sensor.
- For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

- Soldering

- Make sure the package temperature does not exceed 80 °C.
- Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a grounded 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- To dismount an imaging device, do not use a solder suction equipment. When using an electronic desoldering tool, use a thermal controller of the zero cross on/off type and connect to ground.

- Dust and Dirt Protection

- Operate in the clean environments (around class 1000 will be appropriate).
- Do not either touch glass plates by hand or have object come in contact with glass surface. Should dirt stick to a glass surface blow it off with an air blow(for dirt stuck through static electricity ionized air is recommended).
- Clean with a cotton bud and ethyl alcohol if the glass surface is grease stained. Be careful not to scratch the glass.
- Keep in case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- When a protective tape is applied before shipping, just before use remove the tape applied electrostatic protection. Do not reuse the tape.

- Do not expose to strong light (sun rays) for long period, color filter are discolored.

- Exposure to high temperature or humidity will affect the characteristics. accordingly avoid storage or usage in such conditions.

- CCD image sensors are precise optical equipment that should not be subject to mechanical shocks.
