

**1N2804 thru
1N2846B
and
1N4557B thru
1N4564B**

FEATURES

- ZENER VOLTAGE 3.9V to 200V
- AVAILABLE IN TOLERANCES OF $\pm 5\%$, $\pm 10\%$ and $\pm 20\%$
- DESIGNED FOR MILITARY ENVIRONMENTS (See Below)

MAXIMUM RATINGS

Junction and Storage Temperatures: -65°C to $+175^{\circ}\text{C}$
DC Power Dissipation: 50 watts
Power Derating: $0.5\text{W}/^{\circ}\text{C}$ above 75°C
Forward Voltage @ 10 A: 1.5 Volts

*** ELECTRICAL CHARACTERISTICS @ 25°C**

All dimensions in INCH and m.m. **FIGURE 1**

MECHANICAL CHARACTERISTICS

CASE: Industry Standard TO-3, (modified), hermetically sealed, 0.052 inch diameter pins.
FINISH: All external surfaces are corrosion resistant and terminal solderable.
THERMAL RESISTANCE: $1.5^{\circ}\text{C}/\text{W}$ (Typical) junction to base.
POLARITY: Standard Polarity units are connected anode to case. Reverse polarity (cathode to case is indicated by a red dot on the base plate. (Suffix R)
WEIGHT: 15 grams.
MOUNTING HARDWARE: See page 2-9.

*JEDEC Registered Data. **Not JEDEC Data.
†Have JAN, JANTX and JANTXV Qualifications to MIL-S-19500/114.

1N2804 thru 1N2846B, 1N457B thru 1N4564B

NOTE 1 The JEDEC type numbers shown (B suffix) have a $\pm 5\%$ tolerance on nominal zener voltage. The suffix A is used to identify $\pm 10\%$ tolerance; no suffix indicates $\pm 20\%$ tolerance. If tighter tolerance is required, consult factory. Standard polarity units have the anode connected to the case. Reverse polarity (cathode-to-case) units are available and are indicated by suffixing an R to the part number.

NOTE 2 Zener Voltage (V_Z) is measured with junction in thermal equilibrium with 30°C base temperature. The test currents (I_{ZT}) have been selected so that at nominal voltages the dissipation is a constant 12.5 watts. This results in a nominal junction temperature rise of 18.75°C .

NOTE 3 The zener impedance is derived from the 60 cycle A.C. voltage, which results when an A.C. current having an R.M.S. value equal to 10% of the D.C. zener current (I_{ZT} or I_{ZK}) is superimposed on I_{ZT} or I_{ZK} . Zener impedance is measured at 2 points to insure a sharp knee on the breakdown curve and to eliminate unstable units. A curve showing the variation of zener impedance vs. zener current for six representative types is shown in Figure 3. A 100% cathode ray tube curve trace test is used to insure that each zener diode breakdown region begins at a current lower than I_{ZK} and continues at nearly constant voltage to a current level in excess of I_{ZM} .

NOTE 4 The values of I_{ZM} are calculated for a $\pm 5\%$ tolerance on nominal zener voltage. Allowance has been made for the rise in zener voltage above V_{ZT} which results from zener impedance and the increase in junction temperature as power dissipation approaches 50 watts. In the case of individual diodes I_{ZM} is that value of current which results in a dissipation of 50 watts.
