74AC/ACT11157
Quad 2-input multiplexer

FEATURES

- Output capability: ±24 mA
- CMOS (AC) and TTL (ACT) voltage level inputs
- Center-pin V_{CC} and ground configuration to minimize high-speed switching noise
- I_{CC} category: MSI

DESCRIPTION

The 74AC/ACT11157 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT11157 provides four 2-to-1 multiplexers with a common selector and a common enable. The state of the Select (S) input determines the particular input from which the data comes. The Enable (E) input is active-Low. When E is High, all of the outputs (Y) are forced Low regardless of all other input conditions.

The device is the logic implementation of a 4-pole, 2 position switch where the position of the switch is determined by the logic levels supplied to the Select input.

			AC	ACT	
t_{PLH}/t_{PHL}	Propagation delay nI_0, nI_1 to nY	$C_L = 50pF$	4.6	5.9	ns

Note:
1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_I + \Sigma (C_L \times V_{CC}^2 \times f_O) \text{ where:}$$

f_I = input frequency in MHz, C_L = output load capacitance in pF,
f_O = output frequency in MHz, V_{CC} = supply voltage in V,
$\Sigma (C_L \times V_{CC}^2 \times f_O)$ = sum of outputs

NOTES:
1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
