

April 1994 Revised April 1999

# 74VHC4051 • 74VHC4052 • 74VHC4053 8-Channel Analog Multiplexer • Dual 4-Channel Analog Multiplexer • Triple 2-Channel Analog Multiplexer

#### **General Description**

These multiplexers are digitally controlled analog switches implemented in advanced silicon-gate CMOS technology. These switches have low "on" resistance and low "off" leakages. They are bidirectional switches, thus any analog input may be used as an output and vice-versa. Also these switches contain linearization circuitry which lowers the "on" resistance and increases switch linearity. These devices allow control of up to ±6V (peak) analog signals with digital control signals of 0 to 6V. Three supply pins are provided for  $V_{CC}$ , ground, and  $V_{EE}$ . This enables the connection of 0–5V logic signals when  $V_{CC} = 5V$  and an analog input range of  $\pm 5V$  when  $V_{FF} = 5V$ . All three devices also have an inhibit control which when high will disable all switches to their off state. All analog inputs and outputs and digital inputs are protected from electrostatic damage by diodes to V<sub>CC</sub> and ground.

VHC4051: This device connects together the outputs of 8 switches, thus achieving an 8 channel Multiplexer. The binary code placed on the A, B, and C select lines determines which one of the eight switches is "on", and connects one of the eight inputs to the common output.

VHC4052: This device connects together the outputs of 4 switches in two sets, thus achieving a pair of 4-channel multiplexers. The binary code placed on the A, and B select lines determine which switch in each 4 channel section is "on", connecting one of the four inputs in each section to its common output. This enables the implementation of a 4-channel differential multiplexer.

VHC4053: This device contains 6 switches whose outputs are connected together in pairs, thus implementing a triple 2 channel multiplexer, or the equivalent of 3 single-poledouble throw configurations. Each of the A, B, or C select lines independently controls one pair of switches, selecting one of the two switches to be "on"

### Features X

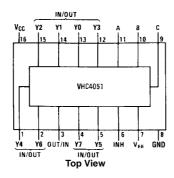

- Wide analog input voltage range: ±6V
- Low "on" resistance: 50 typ. (V<sub>CC</sub>-V<sub>EE</sub> = 4.5V) 30 typ.  $(V_{CC}-V_{EE} = 9V)$
- Logic level translation to enable 5V logic with ±5V ana-
- Low quiescent current: 80 μA maximum
- Matched switch characteristic
- Pin and function compatible with the 74HC4051/ 4052/

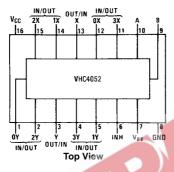

#### Ordering Code:

|                 |                       | VHC4053 | $V_{IS} = V_{EE}$ or $V_{CC}$                        | -6.0V           | 6.0V            |        | ±0.05   | ±0.5          | μA    |
|                 |                       |         | $V_{INH} = V_{IH}$                                   |                 |                 |        |   |               |       |

Note 4: For a power supply of 5V ±10% the worst case on resistances ( $R_{ON}$ ) occurs for VHC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case  $V_{IH}$  and  $V_{IL}$  occur at  $V_{CC}$  = 5.5V and 4.5V respectively. (The  $V_{IH}$  value at 5.5V is 3.85V.) The worst case leakage current occur for CMOS at the higher voltage and so the 5.5V values should be used.

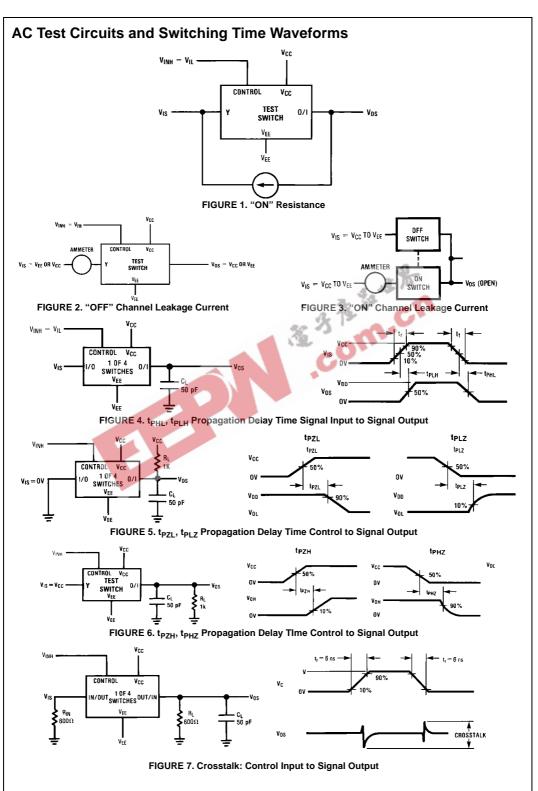

Note 5: At supply voltages  $(V_{CC}-V_{EE})$  approaching 2V the analog switch on resistance becomes extremely non-linear. Therefore it is recommended that these devices be used to transmit digital only when using these supply voltages.

Note 6: Adjust 0 dB for f = 1 kHz (Null R1/R<sub>ON</sub> Attenuation).

# **AC Electrical Characteristics**

# AC Test Circuits and Switching Time Waveforms (Continued)

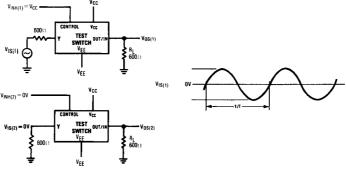

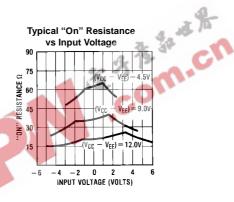

FIGURE 8. Crosstalk Between Any Two Switches

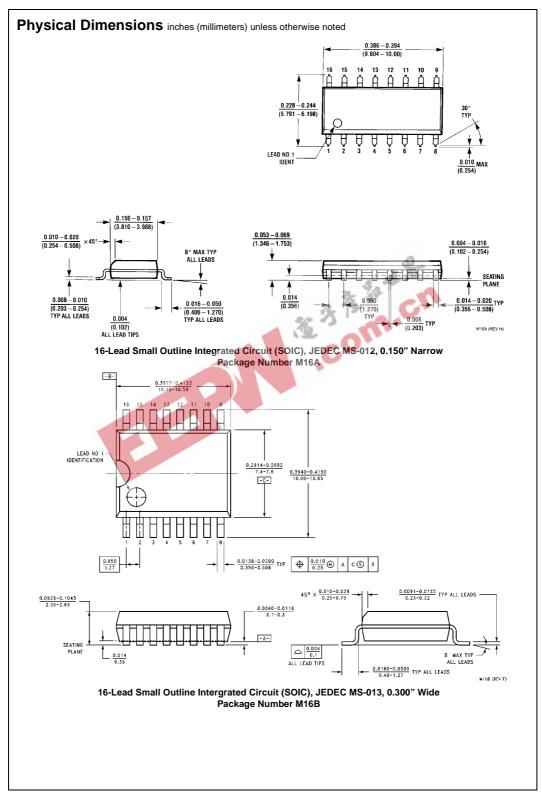

## **Typical Performance Characteristics**

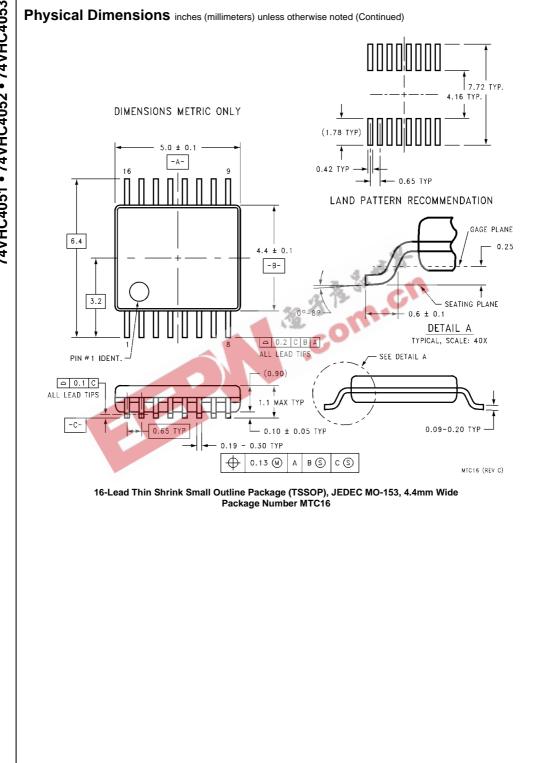

V<sub>CC</sub>=-V<sub>EE</sub>

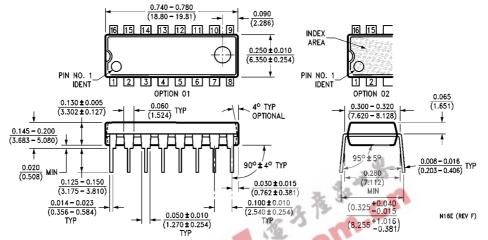

### **Special Considerations**

In certain applications the external load-resistor current may include both  $V_{CC}$  and signal line components. To avoid drawing  $V_{CC}$  current when switch current flows into the analog switch pins, the voltage drop across the switch must not exceed 1.2V (calculated from the ON resistance).

#### Physical Dimensions inches (millimeters) unless otherwise noted (Continued)

16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide Package Number N16E

#### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
