# **Dual 2-to-4 Decoder/ Demultiplexer**

The MC74VHC139 is an advanced high speed CMOS 2–to–4 decoder/demultiplexer fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation. \_

When the device is enabled (E = low), it can be used for gating or as a data input for demultiplexing operations. When the enable input is held high, all four outputs are fixed high, independent of other inputs.

The internal circuit is composed of three stages, including a buffer output which provides high noise immunity and stable output. The inputs tolerate voltages up to 7V, allowing the interface of 5V systems to 3V systems.

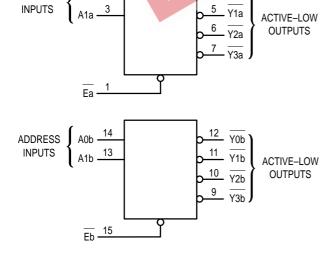

- High Speed: tpp = 5.0ns (Typ) at Vcc = 5V
- Low Power Dissipation:  $I_{CC} = 4\mu A$  (Max) at  $T_A = 25^{\circ}C$
- High Noise Immunity: V<sub>NIH</sub> = V<sub>NIL</sub> = 28% V<sub>CC</sub>
- Power Down Protection Provided on Inputs
- Balanced Propagation Delays
- Designed for 2V to 5.5V Operating Range
- Low Noise: VOLP = 0.8 V (Max)

**ADDRESS** 

- Pin and Function Compatible with Other Standard Logic Families
- Latchup Performance Exceeds 300mA
- ESD Performance: HBM > 2000V; Machine Model > 200V
- Chip Complexity: 100 FETs or 25 Equivalent Gates

T <sub>stg</sub>	Storage Temperature	- 65 to + 150	°C

Absolute maximum continuous ratings are those values beyond which damage to the device may occur. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability. Functional operation under absolute—maximum—rated conditions is not implied.

†Derating — SOIC Packages: – 7 mW/°C from 65° to 125°C TSSOP Package: – 6.1 mW/°C from 65° to 125°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation,  $V_{in}$  and  $V_{out}$  should be constrained to the range GND  $\leq$   $(V_{in}$  or  $V_{out}) \leq$   $V_{CC}$ .

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V<sub>CC</sub>). Unused outputs must be left open.

CPD is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.
 Average operating current can be obtained by the equation: |CC(OPR) = CPD • VCC • f<sub>in</sub> + I<sub>CC</sub>/2 (per decoder). CPD is used to determine the no–load dynamic power consumption; PD = CPD • VCC<sup>2</sup> • f<sub>in</sub> + I<sub>CC</sub> • VCC.
