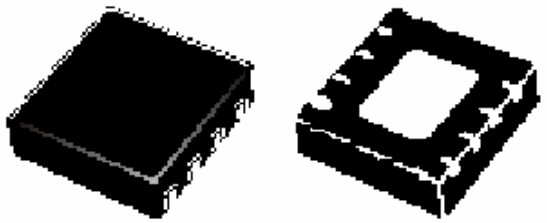
TS4962

2.8W filter-free mono class D audio power amplifier

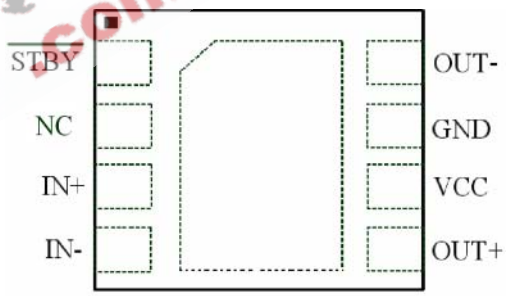
Features

- Operating from V_{CC}=2.4V to 5.5V
- Standby mode active low
- Output power: 2.8W into 4Ω and 1.7W into 8Ω with 10% THD+N max and 5V power supply
- Output power: 2.2W @5V or 0.7W @ 3.0V into 4Ω with 1% THD+N max.
- Output power: 1.4W @5V or 0.5W @ 3.0V into 8Ω with 1% THD+N max.
- Adjustable gain via external resistors
- Low current consumption 2mA @ 3V
- Efficiency: 88% typ.
- Signal to noise ratio: 85dB typ.
- PSRR: 63dB typ. @217Hz with 6dB gain
- PWM base frequency: 280kHz
- Low pop & click noise
- Thermal shutdown protection
- Available in DFN8 3X3 mm package

DFN8 3x3 mm



TS4962IQT - Pinout



Description

The TS4962 is a differential class-D BTL power amplifier. It is able to drive up to 2.2W into a 4Ω load and 1.4W into a 8Ω load at 5V. It achieves outstanding efficiency (88% typ.) compared to standard AB-class audio amps.

The gain of the device can be controlled via two external gain-setting resistors. Pop & click reduction circuitry provides low on/off switch noise while allowing the device to start within 5ms. A standby function (active low) allows the reduction of current consumption to 10nA typ.

Applications

- Cellular phone
- PDA
- Notebook PC

List of tables

List of figures

1 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage(1), (2)	6	V
V_i	Input voltage (3)	GND to V_{CC}	V
T_{oper}	Operating free air temperature range	-40 to + 85	°C
T_{stg}	Storage temperature	-65 to +150	°C
T_j	Maximum junction temperature	150	°C
R_{thja}	Thermal resistance junction to ambient DFN8 package	120	°C/W
Pd	Power dissipation	Internally limited(4)	
ESD	Human body model	2	kV
ESD	Machine model	200	V
Latch-up	Latch-up immunity	200	mA
V_{STBY}	Standby pin voltage maximum voltage (5)	GND to V_{CC}	V
	Lead temperature (soldering, 10sec)	260	°C

1. Caution: This device is not protected in the event of abnormal operating conditions such as, for example, short-circuiting between any one output pin and ground, between any one output pin and V_{CC}, and between individual output pins.
2. All voltage values are measured with respect to the ground pin.
3. The magnitude of the input signal must never exceed V_{CC} + 0.3V / GND - 0.3V.
4. Exceeding the power derating curves during a long period will provoke abnormal operation.
5. The magnitude of the standby signal must never exceed V_{CC} + 0.3V / GND - 0.3V.

Table 2. Dissipation ratings

Package	Derating factor	Power rating @25°C	Power rating @ 85°C
DFN8	20 mW / °C	2.5 W	1.3 W

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage(1)	2.4 to 5.5	V
V_{IC}	Common mode input voltage range(2)	0.5 to V_{CC}-0.8	V
V_{STBY}	Standby voltage input: (3) Device ON Device OFF	 $1.4 \leq V_{STBY} \leq V_{CC}$ $GND \leq V_{STBY} \leq 0.4$ (4)	V
R_L	Load resistor	≥ 4	Ω
R_{thja}	Thermal resistance junction to ambient DFN8 package(5)	50	°C/W

1. For V_{CC} between 2.4V and 2.5V, the operating temperature range is reduced to 0°C ≤T_{amb} ≤70°C.
2. For V_{CC} between 2.4V and 2.5V, the common mode input range must be set at V_{CC}/2.
3. Without any signal on V_{STBY}, the device will be in standby.
4. Minimum current consumption is obtained when V_{STBY} = GND.
5. When mounted on a 4-layer PCB.

2 Application component information

Table 4. Component information

Component	Functional description
C_S	Bypass supply capacitor. Install as close as possible to the TS4962 to minimize high-frequency ripple. A 100nF ceramic capacitor should be added to enhance the power supply filtering at high frequency.
R_{in}	Input resistor used to program the TS4962 differential gain (Gain = 300kΩ/R_{in} with R_{in} in kΩ).
Input capacitor	Because of common mode feedback these input capacitors are optional. However, they can be added to form with R_{in} a 1st order high pass filter with -3dB cut-off frequency = 1/(2*π*R_{in}*C_{in}).

3.2 Electrical characteristics curves

The graphs shown in this section use the following abbreviations:

- R_L + 15µH or 30µH = pure resistor+ very low series resistance inductor
- Filter = LC output filter (1µF+30µH for 4Ω and 0.5µF+60µH for 8Ω)

All measurements are done with C_{S1}=1µF and C_{S2}=100nF (see *Figure 2*), except for the PSRR where C_{S1} is removed (see *Figure 3*).

4 Application information

4.1 Differential configuration principle

The TS4962 is a monolithic fully-differential input/output class D power amplifier. The TS4962 also includes a common-mode feedback loop that controls the output bias value to average it at $V_{CC}/2$ for any DC common mode input voltage. This allows the device to always have a maximum output voltage swing, and by consequence, maximize the output power. Moreover, as the load is connected differentially compared to a single-ended topology, the output is four times higher for the same power supply voltage.

The advantages of a full-differential amplifier are:

- High PSRR (power supply rejection ratio).
- High common mode noise rejection.
- Virtually zero pop without additional circuitry, giving a faster start-up time compared to conventional single-ended input amplifiers.
- Easier interfacing with differential output audio DAC.
- No input coupling capacitors required because of common mode feedback loop.

The main disadvantage is:

- As the differential function is directly linked to external resistor mismatching, paying particular attention to this mismatching is mandatory in order to obtain the best performance from the amplifier.

4.2 Gain in typical application schematic

Typical differential applications are shown in *Figure 1 on page 8*.

In the flat region of the frequency-response curve (no input coupling capacitor effect), the differential gain is expressed by the relation:

$$A_{V_{diff}} = \frac{Out^+ - Out^-}{In^+ - In^-} = \frac{300}{R_{in}}$$

with R_{in} expressed in kΩ

Due to the tolerance of the internal 150kΩ feedback resistor, the differential gain is in the range (no tolerance on R_{in}):

$$\frac{273}{R_{in}} \leq A_{V_{diff}} \leq \frac{327}{R_{in}}$$

4.3 Common mode feedback loop limitations

As explained previously, the common mode feedback loop allows the output DC bias voltage to be averaged at $V_{CC}/2$ for any DC common mode bias input voltage.

However, due to V_{icm} limitation in the input stage (see *Table 3: Operating conditions on page 7*), the common mode feedback loop can play its role only within a defined range. This range depends upon the values of V_{CC} and R_{in} (A_{Vdiff}). To have a good estimation of the V_{icm} value, we can apply this formula (no tolerance on R_{in}):

$$V_{icm} = \frac{V_{CC} \times R_{in} + 2 \times V_{IC} \times 150k\Omega}{2 \times (R_{in} + 150k\Omega)} \quad (V)$$

with

$$V_{IC} = \frac{In^{+} + In^{-}}{2} \quad (V)$$

and the result of the calculation must be in the range:

$$0.5V \leq V_{icm} \leq V_{CC} - 0.8V$$

Due to the +/-9% tolerance on the 150kΩ resistor, it's also important to check V_{icm} in these conditions:

$$\frac{V_{CC} \times R_{in} + 2 \times V_{IC} \times 136.5k\Omega}{2 \times (R_{in} + 136.5k\Omega)} \leq V_{icm} \leq \frac{V_{CC} \times R_{in} + 2 \times V_{IC} \times 163.5k\Omega}{2 \times (R_{in} + 163.5k\Omega)}$$

If the result of V_{icm} calculation is not in the previous range, input coupling capacitors must be used (with V_{CC} between 2.4V and 2.5V, input coupling capacitors are mandatory).

For example:

With V_{CC}=3V, R_{in}=150k and V_{IC}=2.5V, we typically find V_{icm}=2V, which is lower than 3V-0.8V=2.2V. With 136.5kΩ we find 1.97V and with 163.5kΩ we have 2.02V. So, no input coupling capacitors are required.

4.4 Low frequency response

If a low frequency bandwidth limitation is requested, it is possible to use input coupling capacitors.

In the low frequency region, C_{in} (input coupling capacitor) starts to have an effect. C_{in} forms, with R_{in}, a first order high-pass filter with a -3dB cut-off frequency:

$$F_{CL} = \frac{1}{2\pi \times R_{in} \times C_{in}} \quad (Hz)$$

So, for a desired cut-off frequency we can calculate C_{in},

$$C_{in} = \frac{1}{2\pi \times R_{in} \times F_{CL}} \quad (F)$$

with R_{in} in Ω and F_{CL} in Hz.

4.5 Decoupling of the circuit

A power supply capacitor, referred to as C_S, is needed to correctly bypass the TS4962.

The TS4962 has a typical switching frequency at 250kHz and output fall and rise time about 5ns. Due to these very fast transients, careful decoupling is mandatory.

A 1µF ceramic capacitor is enough, but it must be located very close to the TS4962 in order to avoid any extra parasitic inductance being created by an overly long track wire. In relation with dI/dt, this parasitic inductance introduces an overvoltage that decreases the global efficiency and, if it is too high, may cause a breakdown of the device.

In addition, even if a ceramic capacitor has an adequate high frequency ESR value, its current capability is also important. A 0603 size is a good compromise, particularly when a 4Ω load is used.

Another important parameter is the rated voltage of the capacitor. A 1µF/6.3V capacitor used at 5V loses about 50% of its value. In fact, with a 5V power supply voltage, the decoupling value is about 0.5µF instead of 1µF. As C_S has particular influence on the THD+N in the medium-high frequency region, this capacitor variation becomes decisive. In addition, less decoupling means higher overshoots, which can be problematic if they reach the power supply AMR value (6V).

4.6 Wake-up time (t_{WU})

When the standby is released to set the device ON, there is a wait of about 5ms. The TS4962 has an internal digital delay that mutes the outputs and releases them after this time in order to avoid any pop noise.

4.7 Shutdown time (t_{STBY})

When the standby command is set, the time required to put the two output stages into high impedance and to put the internal circuitry in standby mode is about 5ms. This time is used to decrease the gain and avoid any pop noise during the shutdown phase.

4.8 Consumption in standby mode

Between the standby pin and GND there is an internal 300kΩ resistor. This resistor forces the TS4962 to be in standby mode when the standby input pin is left floating.

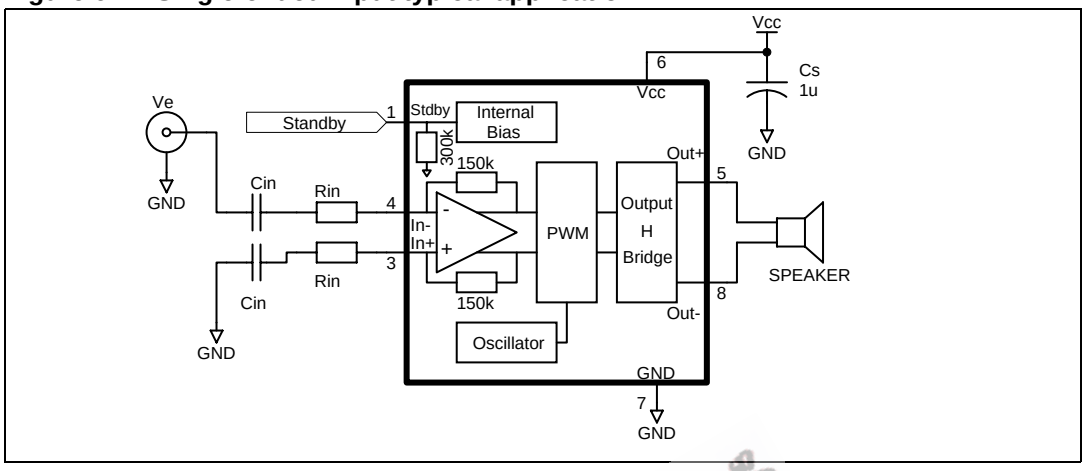
However, this resistor also introduces additional power consumption if the standby pin voltage is not 0V.

For example, with a 0.4V standby voltage pin, *Table 3: Operating conditions on page 7* shows that you must add 0.4V/300kΩ=1.3µA in typical (0.4V/273kΩ=1.46µA in maximum) to the standby current specified in *Table 5 on page 9*.

4.9 Single-ended input configuration

It's possible to use the TS4962 in a single-ended input configuration. However, input coupling capacitors are needed in this configuration. The schematics in *Figure 61* show a single-ended input typical application.

Figure 61. Single-ended input typical application



All formulas are identical except for the gain with R_{in} in kΩ:

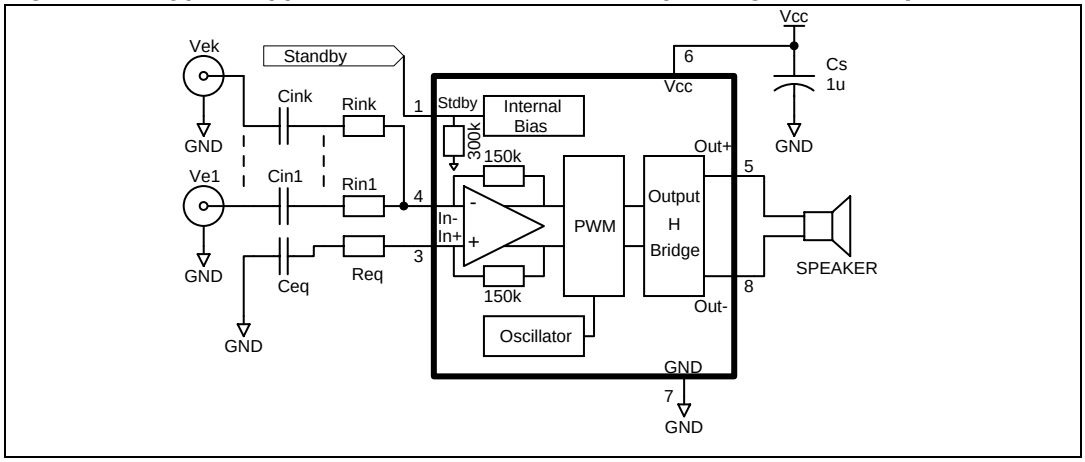
$$A_{V_{single}} = \frac{V_e}{Out^+ - Out^-} = \frac{300}{R_{in}}$$

And, due to the internal resistor tolerance we have:

$$\frac{273}{R_{in}} \leq A_{V_{single}} \leq \frac{327}{R_{in}}$$

In the event that multiple single-ended inputs are summed, it is important that the impedance on both TS4962 inputs (In^- and In^+) are equal.

Figure 62. Typical application schematic with multiple single-ended inputs



We have the following equations:

$$Out^{+} - Out^{-} = V_{e1} \times \frac{300}{R_{in1}} + ... + V_{ek} \times \frac{300}{R_{ink}} \quad (V)$$

$$C_{eq} = \sum_{j=1}^{k} C_{ini}$$

$$C_{ini} = \frac{1}{2 \times \pi \times R_{ini} \times F_{CLi}} \quad (F)$$

$$R_{eq} = \frac{1}{\sum_{j=1}^{k} \frac{1}{R_{ini}}}$$

In general, for mixed situations (single-ended and differential inputs) it is best to use the same rule, that is, to equalize impedance on both TS4962 inputs.

4.10 Output filter considerations

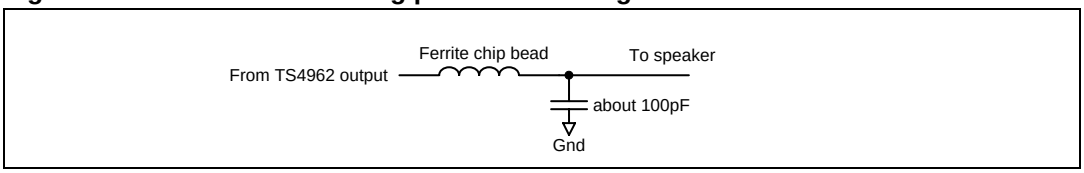
The TS4962 is designed to operate without an output filter. However, due to very sharp transients on the TS4962 output, EMI radiated emissions may cause some standard compliance issues.

These EMI standard compliance issues can appear if the distance between the TS4962 outputs and the loudspeaker terminal is long (typically more than 50mm, or 100mm in both directions, to the speaker terminals). As the PCB layout and internal equipment device are different for each configuration, it is difficult to provide a one-size-fits-all solution.

However, to decrease the probability of EMI issues, there are several simple rules to follow:

- Reduce, as much as possible, the distance between the TS4962 output pins and the speaker terminals.
- Use ground planes for “shielding” sensitive wires.
- Place, as close as possible to the TS4962 and in series with each output, a ferrite bead with a rated current at minimum 2.5A and impedance greater than 50Ω at frequencies above 30MHz. If, after testing, these ferrite beads are not necessary, replace them by a short-circuit.
- Allow enough footprint to place, if necessary, a capacitor to short perturbations to ground (see *Figure 63*).

Figure 63. Method for shorting pertubations to ground

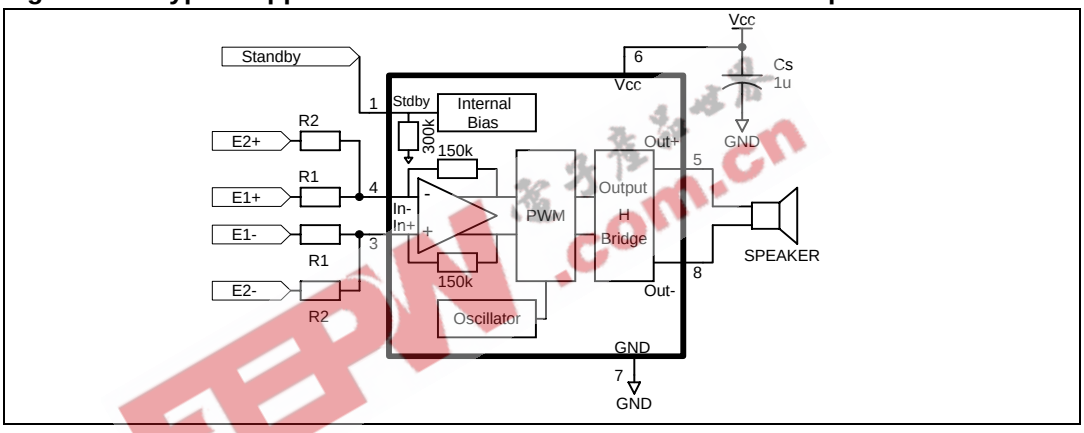


In the case where the distance between the TS4962 output and the speaker terminals is high, it's possible to have low frequency EMI issues due to the fact that the typical operating frequency is 250kHz. In this configuration, we recommend using an output filter (as represented in *Figure 1: Typical application schematics on page 8*). It should be placed as close as possible to the device.

4.11 Several examples with summed inputs

Example 1: Dual differential inputs

Figure 64. Typical application schematic with dual differential inputs



With (R_i in kΩ):

$$A_{V_1} = \frac{Out^+ - Out^-}{E_1^+ - E_1^-} = \frac{300}{R_1}$$

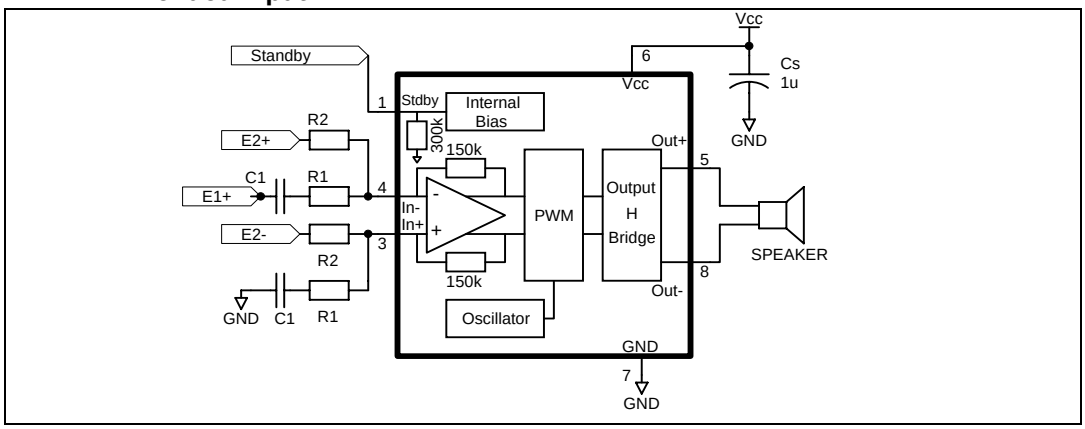
$$A_{V_2} = \frac{Out^+ - Out^-}{E_2^+ - E_2^-} = \frac{300}{R_2}$$

$$0.5V \leq \frac{V_{CC} \times R_1 \times R_2 + 300 \times (V_{IC1} \times R_2 + V_{IC2} \times R_1)}{300 \times (R_1 + R_2) + 2 \times R_1 \times R_2} \leq V_{CC} - 0.8V$$

$$V_{IC_1} = \frac{E_1^+ + E_1^-}{2} \quad \text{and} \quad V_{IC_2} = \frac{E_2^+ + E_2^-}{2}$$

Example 2: One differential input plus one single ended input

Figure 65. Typical application schematic with one differential input plus one single-ended input



With (R_i in kΩ):

$$A_{V_1} = \frac{Out^+ - Out^-}{E_1^+} = \frac{300}{R_1}$$

$$A_{V_2} = \frac{Out^+ - Out^-}{E_2^+ - E_2^-} = \frac{300}{R_2}$$

$$C_1 = \frac{1}{2\pi \times R_1 \times F_{CL}} \text{ (F)}$$

5 Demo board

A demo board for the TS4962 is available. For more information about this demo board, refer to the **Application Note AN2406.**

7 DFN8 package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: www.st.com.
