

Functional Description

The ACT16245 contains sixteen non-inverting bidirectional buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. The following description applies to each byte. When the T/\overline{R} input is HIGH, then Bus A data is transmitted to Bus B. When the T/\overline{R} input is LOW,

Bus B data is transmitted to Bus A. The 3-STATE outputs are controlled by an Output Enable (\overline{OE}_n) input for each byte. When \overline{OE}_n is LOW, the outputs are in 2-state mode. When \overline{OE}_n is HIGH, the outputs are in the high impedance mode, but this does not interfere with entering new data into the inputs.

Note 1: Absolute maximum ratings are those value	s beyond which damage

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of FACTTM circuits outside databook specifications.
