Octal Bus Transceiver with 3-STATE Outputs

General Description

These devices are octal bus transceivers designed for asynchronous two-way data flow between the A and B buses. Both busses are capable of sinking 64 mA, have 3-STATE outputs, and a common output enable pin. The direction of data flow is determined by the transmit/receive (T/R) input. The 74F645 is a high speed/low power version of the 74F245. The 74F640 is an inverting option of the 74F645.

Features

- Designed for asynchronous two-way data flow between busses
- Outputs sink 64 mA
- Transmit/receive (T/R) input controls the direction of data flow
- 74F645 is a lower power, faster version of the 74F245
- 74F640 is an inverting option of the 74F645

Functional Description

The output enable (\overline{OE}) is active LOW. If the device is disabled (\overline{OE} HIGH), the outputs are in the high impedance state. The transmit/receive input (T/\overline{R}) controls whether data is transmitted from the A bus to the B bus or from the B bus to the A bus. When T/\overline{R} is LOW, B data is sent to the A bus. If T/\overline{R} is HIGH, A data is sent to the B bus.
