

## 74ACTQ827

### Quiet Series™ 10-Bit Buffer/Line Driver with 3-STATE Outputs

#### General Description

The ACTQ827 10-bit bus buffer provides high performance bus interface buffering for wide data/address paths or buses carrying parity. The 10-bit buffers have NOR output enables for maximum control flexibility. The ACTQ827 utilizes Fairchild Quiet Series™ technology to guarantee quiet output switching and improved dynamic threshold performance. FACT Quiet Series™ features GTO™ output control and undershoot corrector in addition to a split ground bus for superior performance.

#### Features

- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed pin-to-pin skew AC performance
- Inputs and outputs on opposite sides of package allow easy interface with microprocessors
- Improved latch-up immunity
- Outputs source/sink 24 mA
- Functionally and pin-compatible to AMD's AM29827
- Has TTL-compatible inputs

#### Ordering Code:

| Order Number | Package Number | Package Description   |
|--------------|----------------|---|
| 74ACTQ827SC  | M24B           | 24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide Body |
| 74ACTQ827SPC | N24C           | 24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-100, 0.300" Wide          |

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

#### Pin Descriptions

| Pin Names                          | Description   |
|------------------------------------|---------------|
| $\overline{OE}_1, \overline{OE}_2$ | Output Enable |
| $D_0$ - $D_9$                      | Data Inputs   |
| $O_0$ - $O_9$                      | Data Outputs  |

## Functional Description

The ACTQ827 line driver is designed to be employed as memory address driver, clock driver and bus-oriented transmitter/receiver. The devices have 3-STATE outputs controlled by the Output Enable ( $\overline{OE}$ ) pins. When the  $\overline{OE}$  is LOW, the device is transparent. When  $\overline{OE}$  is HIGH, the device is in 3-STATE mode.

## Function Table

| Inputs          |       | Outputs | Function    |
|-----------------|-------|---------|-------------|
| $\overline{OE}$ | $D_n$ | $O_n$   |             |
| L               | H     | H       | Transparent |
| L               | L     | L       | Transparent |
| H               | X     | Z       | High Z      |

H = HIGH Voltage Level  
L = LOW Voltage Level  
Z = HIGH Impedance  
X = Immaterial

## Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

| Absolute Maximum Ratings (Note 1)        |                          | Junction Temperature ( $T_J$ )   |                |
|--|--------------------------|--|----------------|
| Supply Voltage ( $V_{CC}$ )              | -0.5V to +7.0V           | PDIP   | 140°C          |
| DC Input Diode Current ( $I_{IK}$ )      |                          | <b>Recommended Operating Conditions</b>  |                |
| $V_I = -0.5V$                            | -20 mA                   | Supply Voltage ( $V_{CC}$ )  | 4.5V to 5.5V   |
| $V_I = V_{CC} + 0.5V$                    | +20 mA                   | Input Voltage ( $V_I$ )  | 0V to $V_{CC}$ |
| DC Input Voltage ( $V_I$ )               | -0.5V to $V_{CC} + 0.5V$ | Output Voltage ( $V_O$ )   | 0V to $V_{CC}$ |
| DC Output Diode Current ( $I_{OK}$ )     |                          | Operating Temperature ( $T_A$ )  | -40°C to +85°C |
| $V_O = -0.5V$                            | -20 mA                   | Minimum Input Edge Rate $\Delta V/\Delta t$  | 125 mV/ns      |
| $V_O = V_{CC} + 0.5V$                    | +20 mA                   | $V_{IN}$ from 0.8V to 2.0V   |                |
| DC Output Voltage ( $V_O$ )              | -0.5V to $V_{CC} + 0.5V$ | $V_{CC}$ @ 4.5V, 5.5V  |                |
| DC Output Source                         |                          | <b>Note 1:</b> Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of FACT™ circuits outside databook specifications. |                |
| or Sink Current ( $I_O$ )                | $\pm 50$ mA              |  |                |

| C <sub>PD</sub> | Power Dissipation Capacitance | 82  | pF    | V <sub>CC</sub> = 5.0V |

## FACT Noise Characteristics

The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

### Equipment:

Hewlett Packard Model 8180A Word Generator  
PC-163A Test Fixture  
Tektronics Model 7854 Oscilloscope

### Procedure:

1. Verify Test Fixture Loading: Standard Load 50 pF, 500Ω.
2. Deskew the HFS generator so that no two channels have greater than 150 ps skew between them. This requires that the oscilloscope be deskewed first. It is important to deskew the HFS generator channels before testing. This will ensure that the outputs switch simultaneously.
3. Terminate all inputs and outputs to ensure proper loading of the outputs and that the input levels are at the correct voltage.
4. Set the HFS generator to toggle all but one output at a frequency of 1 MHz. Greater frequencies will increase DUT heating and effect the results of the measurement.
5. Set the word generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with an oscilloscope.

**Note 9:**  $V_{OHV}$  and  $V_{OLP}$  are measured with respect to ground reference.

**Note 10:** Input pulses have the following characteristics:  $f = 1$  MHz,  $t_r = 3$  ns,  $t_f = 3$  ns, skew < 150 ps.

**FIGURE 1. Quiet Output Noise Voltage Waveforms**

$V_{OLP}/V_{OLV}$  and  $V_{OHP}/V_{OHV}$ :

- Determine the quiet output pin that demonstrates the greatest noise levels. The worst case pin will usually be the furthest from the ground pin. Monitor the output voltages using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- Measure  $V_{OLP}$  and  $V_{OLV}$  on the quiet output during the worst case transition for active and enable. Measure  $V_{OHP}$  and  $V_{OHV}$  on the quiet output during the worst case active and enable transition.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

$V_{ILD}$  and  $V_{IHD}$ :

- Monitor one of the switching outputs using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- First increase the input LOW voltage level,  $V_{IL}$ , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds  $V_{IL}$  limits, or on output HIGH levels that exceed  $V_{IH}$  limits. The input LOW voltage level at which oscillation occurs is defined as  $V_{ILD}$ .
- Next decrease the input HIGH voltage level,  $V_{IH}$ , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds  $V_{IL}$  limits, or on output HIGH levels that exceed  $V_{IH}$  limits. The input HIGH voltage level at which oscillation occurs is defined as  $V_{IHD}$ .
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

74ACTQ827

**Physical Dimensions** inches (millimeters) unless otherwise noted

**24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide Body  
Package Number M24B**

24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-100, 0.300" Wide  
 Package Number N24C

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
