

10-bit bus interface latch (3-State)

74ABT841

FEATURES

- High speed parallel latches
- Extra data width for wide address/data paths or buses carrying parity
- Ideal where high speed, light loading, or increased fan-in are required with MOS microprocessors
- Slim DIP 300 mil package
- Broadside pinout
- Output capability: +64mA/-32mA
- Latch-up protection exceeds 500mA per Jedec Std 17
- ESD protection exceeds 2000 V per MIL STD 883 Method 3015 and 200 V per Machine Model
- Power-up 3-State
- Power-up reset

DESCRIPTION

The 74ABT841 Bus interface register is designed to provide extra data width for wider data/address paths of buses carrying parity.

The 74ABT841 consists of ten D-type latches with 3-State outputs. The flip-flops appear transparent to the data when Latch Enable (LE) is High. This allows asynchronous operation, as the output transition follows the data in transition. On the LE High-to-Low transition, the data that meets the setup and hold time is latched.

Data appears on the bus when the Output Enable (\overline{OE}) is Low. When \overline{OE} is High the output is in the High-impedance state.

NOTES:

- Not more than one output should be tested at a time, and the duration of the test should not exceed one second.
- This is the increase in supply current for each input at 3.4V.
- For valid test results, data must not be loaded into the flip-flops (or latches) after applying the power.
- This parameter is valid for any V_{CC} between 0V and 2.1V with a transition time of up to 10msec. For V_{CC} = 2.1V to V_{CC} = 5V ± 10%, a transition time of up to 100µsec is permitted.
