### 8-Bit Dual Supply Configurable Voltage Interface Transceiver with 3-STATE Outputs

#### General Description

The LVXC3245 is a 24-pin dual-supply, 8-bit configurable voltage interface transceiver suited for PCMCIA and other real time configurable I/O applications. The  $V_{CCA}$  pin accepts a 3V supply level. The A Port is a dedicated 3V port. The  $V_{CCB}$  pin accepts a 3V-to-5V supply level. The B Port is configured to track the  $V_{CCB}$  supply level respectively. A 5V level on the  $V_{CC}$  pin will configure the I/O pins at a 5V level and a 3V  $V_{CC}$  will configure the I/O pins at a 3V level. The A Port should interface with a 3V host system and the B Port to the card slots. This device will allow the  $V_{CCB}$  voltage source pin and I/O pins on the B Port to float when  $\overline{OE}$  is HIGH. This feature is necessary to buffer data to and from a PCMCIA socket that permits PCMCIA cards to be inserted and removed during normal operation.

#### Features

- Bidirectional interface between 3V and 3V-to-5V buses
- Control inputs compatible with TTL level
- Outputs source/sink up to 24 mA
- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Implements patented EMI reduction circuitry
- Flexible  $V_{CCB}$  operating range
- Allows B Port and  $V_{CCB}$  to float simultaneously when  $\overline{OE}$  is HIGH
- Functionally compatible with the 74 series 245

The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 2:** The A Port unused pins (inputs or I/Os) must be held HIGH or LOW. They may not float.
