## 74FR244 Octal Buffer/Line Driver with 3-STATE Outputs

### **General Description**

The 74FR244 is a non-inverting octal buffer and line driver designed to be employed as memory and address driver, clock driver and bus-oriented transmitter/receiver.

#### Features

3-STATE outputs drive bus lines or buffer memory address registers

December 1990

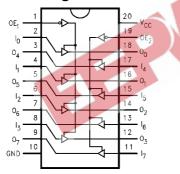

Revised May 2001

- Outputs sink 64 mA and source 15 mA
- Guaranteed pin-to-pin skew

### **Ordering Code:**

	Package Description				
M20B	20-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide				
M20D	20-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide				
N20A	20-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide				
-	M20D

Note 3: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase, i.e., all LOW-to-HIGH, HIGH-to-LOW, 3-STATE-to-HIGH, etc. Note 4: These specifications guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

Note 5: Skew is defined as the absolute value of the difference between the actual propagation delays for any two outputs of the same device. The specification applies to any outputs switching HIGH-to-LOW, (t<sub>OSHL</sub>), LOW-to-HIGH, (t<sub>OSLH</sub>), or HIGH-to-LOW and/or LOW-to-HIGH, (t<sub>OST</sub>). Specification guaranteed with all outputs switching in phase.
