SEMICONDUCTOR

# 74ACT18823 18-Bit D-Type Flip-Flop with 3-STATE Outputs

### **General Description**

The ACT18823 contains eighteen non-inverting D-type flipflops with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. A buffered clock (CP), Clear (CLR), Clock Enable (EN) and Output Enable (OE) are common to each byte and can be shorted together for full 18-bit operation.

## Features

- Broadside pinout allows for easy board layout
- Separate control logic for each byte
- Extra data width for wider address/data paths or buses carrying parity

August 1999

Revised October 1999

- Outputs source/sink 24 mA
- TTL-compatible inputs

© 1999 Fairchild Semiconductor Corporation DS500294

### **Functional Description**

The ACT18823 consists of eighteen D-type edge-triggered flip-flops. These have 3-STATE outputs for bus systems organized with inputs and outputs on opposite sides. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. The following description applies to each byte. The buffered clock (CP<sub>n</sub>) and buffered Output Enable ( $\overline{OE}_n$ ) are common to all flip-flops within that byte. The flip-flops will store the state of their individual D inputs that meet set-up and hold time requirements on the LOW-to-HIGH  $\ensuremath{\mathsf{CP}}\xspace_n$  transition. With OE<sub>n</sub> LOW, the contents of the flip-flops are available at the outputs. When  $\overline{\text{OE}}_n$  is HIGH, the outputs go to the impedance state. Operation of the  $\overline{OE}_n$  input does not affect the state of the flip-flops. In addition to the Clock and Output Enable pins, there are Clear  $(\overline{\text{CLR}}_n)$  and Clock Enable  $(\overline{EN}_n)$  pins. These devices are ideal for parity bus interfacing in high performance systems.

When  $\overline{CLR}_n$  is LOW and  $\overline{OE}_n$  is LOW, the outputs are LOW. When  $\overline{CLR}_n$  is HIGH, data can be entered into the flip-flops. When  $\overline{EN}_n$  is LOW, data on the inputs is transferred to the outputs on the LOW-to-HIGH clock transition. When the  $\overline{EN}_n$  is HIGH, the outputs do not change state, regardless of the data or clock input transitions.

## **Function Table**

(Note 1)

	I	Inputs	5	Internal	Output	Function		
OE	CLR	EN	СР	I <sub>n</sub>	Q	0 <sub>n</sub>	Function	
Н	х	L	$\langle$	L	L	Z	High Z	
н	х	L	~	н	н	Z	High Z	
н	L	х	х	х	L	Z	Clear	
L	L	х	х	х	L	L	Clear	
н	н	н	х	х	NC	Z	Hold	
L	н	н	х	х	NC	NC	Hold	
н	н	L	~	L	L	Z	Load	
н	н	L	~	н	н	Z	Load	
L	н	L	~	L	L	L	Load	
L	н	L	~	H	н	н	Load	

L= LOW Voltage Level X= Immaterial Z= High Impedance

LOW-to-HIGH Transition

NC= No Change

Note 1: The table represents the logic for one byte. The two bytes are inde-pendent of each other and function identically.

## Absolute Maximum Ratings(Note 2)

Supply Voltage (V <sub>CC</sub> )	-0.5V to +7.0V
DC Input Diode Current (I <sub>IK</sub> )	
$V_{I} = -0.5V$	–20 mA
$V_I = V_{CC} + 0.5V$	+20 mA
DC Output Diode Current (I <sub>OK</sub> )	
$V_{O} = -0.5V$	–20 mA
$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage (V <sub>O</sub> )	–0.5V to $V_{CC}$ + 0.5V
DC Output Source/Sink Current (I <sub>O</sub> )	$\pm$ 50 mA
DC V <sub>CC</sub> or Ground Current	
Per Output Pin	± 50 mA
Junction Temperature	
PDIP/SOIC	+140°C
Storage Temperature	$-65^{\circ}C$ to $+150^{\circ}C$

# Recommended Operating Conditions

Supply Voltage (V <sub>CC</sub> )	4.5V to 5.5V
Input Voltage (V <sub>I</sub> )	0V to V <sub>CC</sub>
Output Voltage (V <sub>O</sub> )	0V to V <sub>CC</sub>
Operating Temperature (T <sub>A</sub> )	$-40^{\circ}C$ to $+85^{\circ}C$
Minimum Input Edge Rate (ΔV/Δt)	125 mV/ns
V <sub>IN</sub> from 0.8V to 2.0V	
V <sub>CC</sub> @ 4.5V, 5.5V	
Note 2: Absolute maximum ratings are those value	s beyond which damage

Note 2: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of FACT™ circuits outside databook specifications.
