TWO TERMINAL THYRISTOR SERIES

SURFACE MOUNT AND AXIAL LEAD TWO TERMINAL THYRISTOR (3T) SURGE SUPPRESSOR

FEATURES

- UL94V-O Fammability Classification
- ESD Protection >40 kilovolts
- Low Capacitance for T1/E1 Trunk and Line card applications
- High Surge Current Capability (See Electrical Characteristics)
- Peak Off-State Voltage from 58 to 300 volts
- Meet IEC100-4-4 & 5 Industry Requirement
- Provides Protection in Accordance with FCC Part 68, UL1459, Bellcore 189, ITU-TK, 20 & k. 21

DEVICE SYMBOL

MECHANICAL DATA

Case: JEDEC DO-15 Molded plastic over glass passivated junction
Terminals: Solder plated axial leads, solderable per MIL-STD-750, Method 2026
Polarity: Color band denoted positive end (cathode) except Bipolar
Mounting Position: Any
Weight: 0.015 ounces, 0.4 grams

MECHANICAL DATA

Case: JEDEC DO214AA. Molded plastic over glass passivated junction
Terminals: Solder plated, solderable per MIL-STD-750, Method 2026
Polarity: Color band denoted positive end (cathode) except Bidirectional
Standard Packaging: 12mm tape (EIA STD RS-481)
Weight: 0.003 ounces, 0.093 grams

Application Notes for Thyristor Surge Suppressors used in Telecommunication Circuits

FIGURE 8 - UL 1459 & FCC Part 68 Metallic Protection

The 3T device is located across the tip-to-ring line after a limiting resistor and fuse combination. R_{TIP} and R_{RING} resistors are optional depending upon the 3T device selection. Without the resistors, the 3T310B is recommended. However, with a resistance value of 7.5 ohms for tip and ring, the 3T310A is recommended. Digital signals may use a lower 3T device depending upon the total tip to ring voltage range. Selection of the 3T device, either 3TXXXA or B is based upon the value of the tip and ring resistors. For the National Electronic Code (NEC) article 800, it is recommended that at least one fuse be used in the tip or ring line for metallic surges. Fuses may be replaced with a suitable Positive Temperature Coefficient (PTC) automatic resettable current limiting device.

FIGURE 9 - UL 1459 & FCC Part 68 - Longitudinal Protection

There are two 3T devices, one located from tip-to-ground and one ring-to-ground. For standard analog signals, the 3T310A is recommended with a typical resistor value for tip and ring of 15 ohms. The 3T310B is recommended for resistor values of 7.5 ohms each. The National Electronic Code (NEC) article 800 requires two fuse elements when connecting to ground. Fuses or a suitable Positive Temperature Coefficient (PTC) automatic resettable current limiting device may be used. The purpose of this circuit is to limit AC power current from getting on the ground line causing any safety hazard.

FIGURE 10 - UL 1459 & FCC Part 68 - Metallic and Longitudinal Protection

Three equal 3T devices are used in this application for metallic (tip-to-ring) and longitudinal (tip-to-ground and ring-to-ground) protection. For analog signals, the 3T310B is recommended. With a resistance value of 15 ohms for the tip and ring resistors, the 3T310A may be used. The National Electric Code (NEC) article 800 requires two fuse elements when connecting to ground. Fuses or a suitable Positive Temperature Coefficient (PTC) automatic resettable current limiting device may be used. This is circuit is recommended for protection against the Bellcore requirement: First Level Lightning Surge Tests (Telecommunications Port), document # GR-1089-CORE.
