

74LVQ374

Functional Description

The LVQ374 consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual D-type inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable ($\overline{\text{OE}}$) LOW, the contents of the eight flip-flops are available at the outputs. When the $\overline{\text{OE}}$ is HIGH, the outputs go to the high impedance state. Operation of the $\overline{\text{OE}}$ input does not affect the state of the flip-flops.

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device solution which operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual during expertise. Note 2: Unused inputs must be held HIGH or LOW. They may not float.
