DESCRIPTION

The M54/74HC367 and the M54/74HC368 are high speed CMOS HEX BUS BUFFER (3-STATE) fabricated in silicon gate C²MOS technology. They have the same high speed performance of LSTTL combined with true CMOS low power consumption. These devices contain six buffers, four buffers are controlled by an enable input (G_1) and the other two buffers are controlled by the other enable input (\overline{G}_2) ; the outputs of each buffer group are enabled when \overline{G}_1 and/or \overline{G}_2 inputs are held low, and when held high these outputs are disabled to be high-impedance.

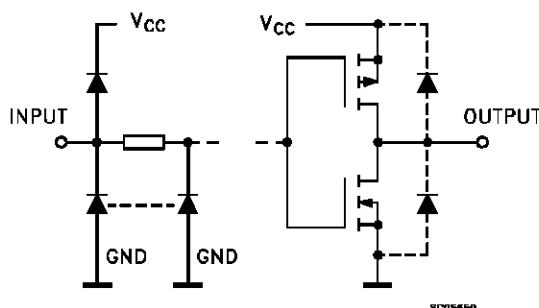

These outputs are capable of driving up to 15 LSTTL loads. The designer has a choice of non-inverting outputs (HC367) and inverting outputs (HC368).

All inputs are equipped with protection circuits against static discharge and transient excess voltage.

$C_{PD} (*)$	Power Dissipation Capacitance					33						pF

(*) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(\text{opr})} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/6$ (per Channel)

TEST CIRCUIT I_{CC} (Opr.)

C_{PD} CALCULATION

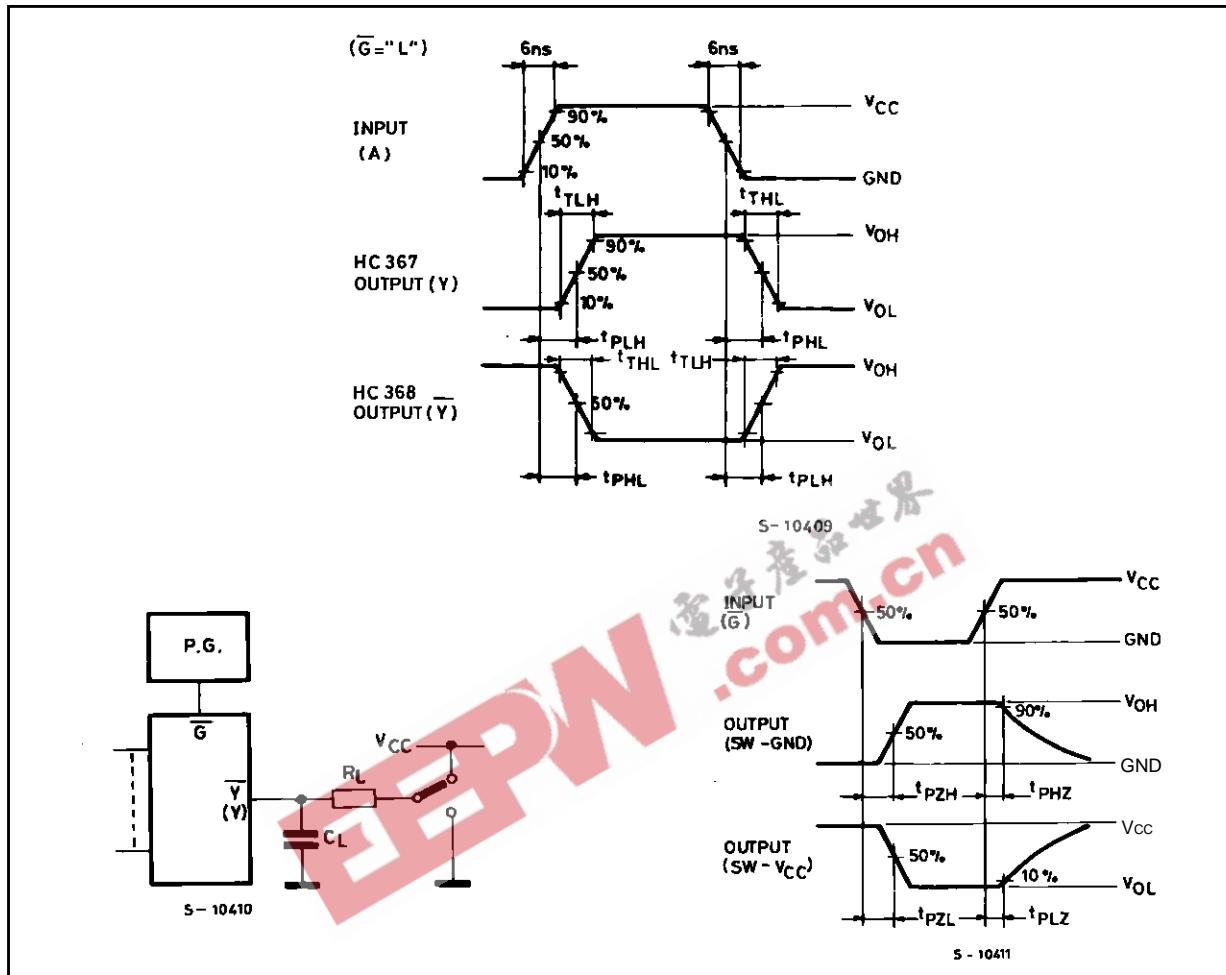

C_{PD} is to be calculated with the following formula by using the measured value of I_{CC} (opr.) in the test circuit opposite.

$$C_{PD} = \frac{I_{CC(\text{opr})}}{f_{IN} \times V_{CC}}$$

In determining the typical value of C_{PD} , a relatively high frequency of 1 MHz was applied to f_{IN} , in order to eliminate any error caused by the quiescent supply current.
