

## TS2007FC

3 W filter-free class D audio power amplifier  
with 6 or 12 dB fixed gain select

### Features

- Operates from  $V_{CC}=2.4\text{ V}$  to  $5.5\text{ V}$
- Standby mode active low
- Output power:  $1.4\text{ W}$  at  $5\text{ V}$  or  $0.5\text{ W}$  at  $3.0\text{ V}$  into  $8\ \Omega$  with 1% THD+N max.
- Output power:  $2.3\text{ W}$  at  $5\text{ V}$  or  $0.75\text{ W}$  at  $3.0\text{ V}$  into  $4\ \Omega$  with 1% THD+N max.
- Two fixed gain selects: 6 dB or 12 dB
- Low current consumption
- Efficiency: 86% typical
- Signal-to-noise ratio: 90 dB typical
- PSRR: 68 dB typical at 217 Hz with 6 dB gain
- PWM base frequency: 280 kHz
- Low pop and click noise
- Thermal shutdown protection
- Output short-circuit protection
- Flip-chip lead-free 9-bump package with back coating in option.

### Applications

- Cellular phone
- PDA
- Notebook PC

### Description

The TS2007FC is a class D power audio amplifier. Able to drive up to  $1.4\text{ W}$  into an  $8\ \Omega$  load at  $5\text{ V}$ , it achieves better efficiency than typical class AB audio power amplifiers.

This device can switch between two gain settings, 6 dB or 12 dB via a logic signal on the gain select pin. Pop and click reduction circuitry provides low on/off switch noise and allows the device to start within 1 ms typically.

TS2007EIJT - 9-bump flip-chip

Pinout (top view)

A standby mode function (active low) keeps the current consumption down to  $1\ \mu\text{A}$  typical.

The TS2007FC is available in a 9-bump flip-chip lead-free package.

# 1 Absolute maximum ratings and operating conditions

**Table 1. Absolute maximum ratings (AMR)**

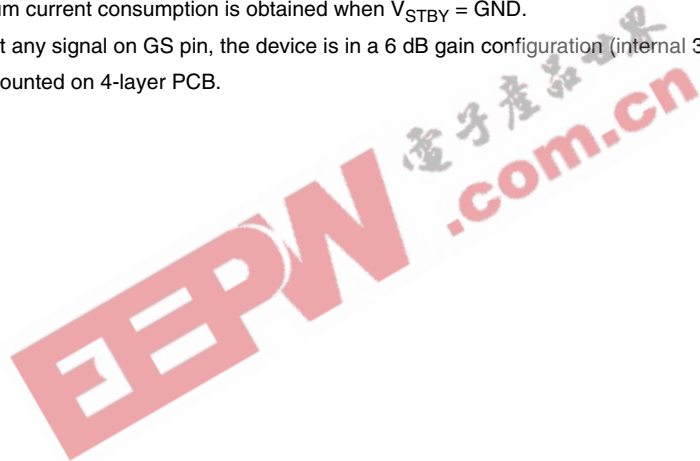

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6	V
$V_{in}$	Input voltage <sup>(2)</sup>	GND to $V_{CC}$	V
$T_{oper}$	Operating free-air temperature range	-40 to + 85	°C
$T_{stg}$	Storage temperature	-65 to +150	°C
$T_j$	Maximum junction temperature	150	°C
$R_{thja}$	Thermal resistance junction to ambient <sup>(3)</sup>	200	°C/W
$P_d$	Power dissipation	Internally limited <sup>(4)</sup>	
ESD	Human body model <sup>(5)</sup>	2	kV
	Machine model <sup>(6)</sup>	200	V
Latch-up	Latch-up immunity	Class A = 200	mA
	Lead temperature (soldering, 10 sec)	260	°C
	Output short circuit protection <sup>(7)</sup>		

- All voltage values are measured with respect to the ground pin.
- The magnitude of input signal must never exceed  $V_{CC} + 0.3\text{ V} / \text{GND} - 0.3\text{ V}$
- The device is protected in case of over temperature by a thermal shutdown active @ 150° C.
- Exceeding the power derating curves during a long period provokes abnormal operating conditions.
- Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
- Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
- Implemented short-circuit protection protects the amplifier against damage by short-circuit between positive and negative outputs and between outputs and ground.

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	2.4 to 5.5	V
$V_{in}$	Input voltage range	GND to $V_{CC}$	V
$V_{icm}$	Input common mode voltage range <sup>(1)</sup>	GND + 0.15 V to $V_{CC} - 0.7$ V	V
$V_{STBY}$	Standby voltage input: <sup>(2)</sup> Device ON Device OFF	$1.4 \leq V_{STBY} \leq V_{CC}$ <sup>(3)</sup> $GND \leq V_{STBY} \leq 0.4$	V
$V_{GS}$	Gain select input voltage: <sup>(4)</sup> Gain = 6 dB Gain = 12 dB	$1.4 \leq V_{GS} \leq V_{CC}$ $GND \leq V_{GS} \leq 0.4$	V
$R_L$	Load resistor	$\geq 4$	$\Omega$
$R_{thja}$	Thermal resistance junction to ambient <sup>(5)</sup>	90	$^{\circ}C/W$

1.  $|V_{ool}| \leq 35$  mV max with both differential gains.
2. Without any signal on  $V_{STBY}$ , the device is in standby (internal 300 k $\Omega$  pull down resistor).
3. Minimum current consumption is obtained when  $V_{STBY} = GND$ .
4. Without any signal on GS pin, the device is in a 6 dB gain configuration (internal 300 k $\Omega$  pull up resistor).
5. With mounted on 4-layer PCB.

## 2 Application information

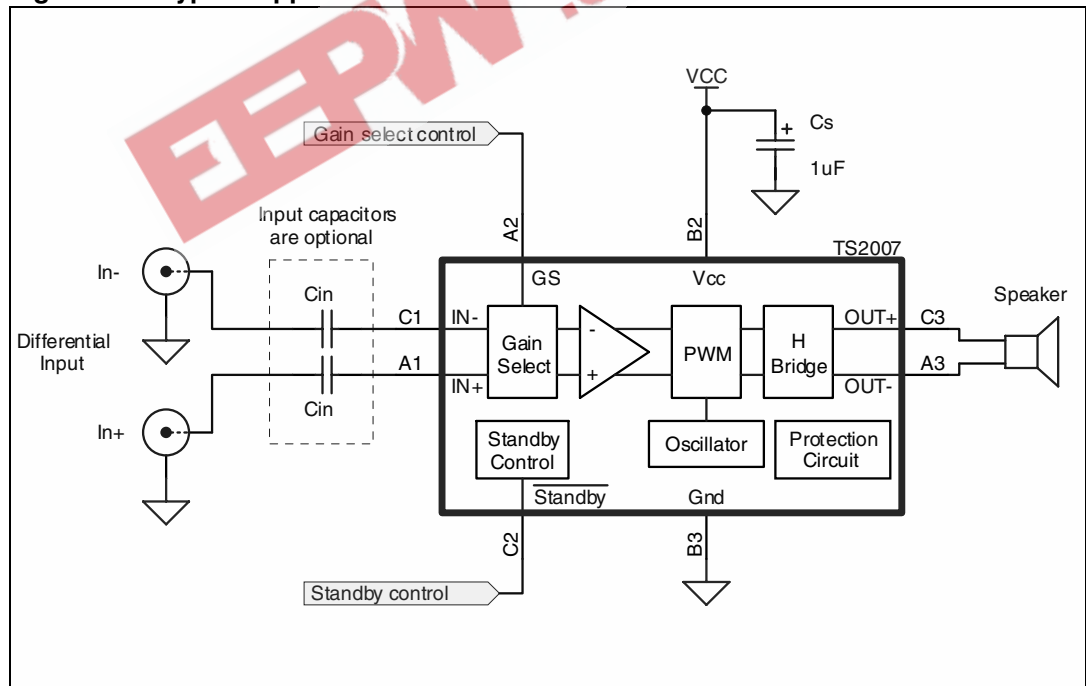

**Table 3. External component description**

Components	Functional description
C <sub>s</sub>	Supply capacitor that provides power supply filtering.
C <sub>in</sub>	Input coupling capacitors (optional) that block the DC voltage at the amplifier input terminal. These capacitors also form a high pass filter with Z <sub>in</sub> ( $F_c = 1 / (2 \times \pi \times Z_{in} \times C_{in})$ ).

**Table 4. Pin description**

Pin name	Pin description
IN+	Positive differential input
VCC	Power supply
IN-	Negative differential input
GS	Gain select input
STDBY	Standby pin (active low)
GND	Ground
OUT+	Positive differential output
OUT-	Negative differential output

**Figure 1. Typical application**

Note: See [Section 4.10: Output filter considerations](#) on page 23.

### 3 Electrical characteristics

#### 3.1 Electrical characteristics tables

Table 5.  $V_{CC} = +5\text{ V}$ ,  $GND = 0\text{ V}$ ,  $V_{IC} = 2.5\text{ V}$ ,  $T_{amb} = 25^\circ\text{C}$  (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit

$F_{PWM}$	Pulse width modulator base frequency	190	280	370	kHz
SNR	Signal-to-noise ratio (A-weighting), F=1 kHz, $P_o = 0.5\text{ W}$ G = 6 dB, $R_L = 4\ \Omega$ (with LC output filter)		88		dB
$t_{WU}$	Wake-up time		1	3	ms
$t_{STBY}$	Standby time		1		ms
$V_N$	Output voltage noise, F = 20 Hz to 20 kHz, $R_L = 4\ \Omega$ Unweighted (filterless, G = 6 dB) A-weighted (filterless, G = 6 dB) Unweighted (with LC output filter, G = 6 dB) A-weighted (with LC output filter, G = 6 dB) Unweighted (filterless, G = 12 dB) A-weighted (filterless, G = 12 dB) Unweighted (with LC output filter, G = 12 dB) A-weighted (with LC output filter, G = 12 dB)		82 56 77 55 100 73 98 70		$\mu\text{V}_{RMS}$

1. Standby mode is active when  $V_{STBY}$  is tied to GND.

2. Dynamic measurements -  $20 \cdot \log(\text{rms}(V_{out})/\text{rms}(V_{ripple}))$ .  $V_{ripple}$  is the superimposed sinus signal to  $V_{CC}$  @ F= 217 Hz.

3. Independent of Gain configuration (6 or 12 dB) and between IN+ or IN- and GND.

### 3.2 Electrical characteristic curves

The graphs shown in this section use the following abbreviations:

- $R_L + 15 \mu\text{H}$  or  $30 \mu\text{H}$  = pure resistor + very low series resistance inductor
- Filter = LC output filter ( $1 \mu\text{F} + 30 \mu\text{H}$  for  $4 \Omega$  and  $0.5 \mu\text{F} + 15 \mu\text{H}$  for  $8 \Omega$ )

All measurements are done with  $C_{S1} = 1 \mu\text{F}$  and  $C_{S2} = 100 \text{ nF}$  (Figure 2), except for the PSRR where  $C_{S1}$  is removed (Figure 3).

Figure 2. Test diagram for measurements

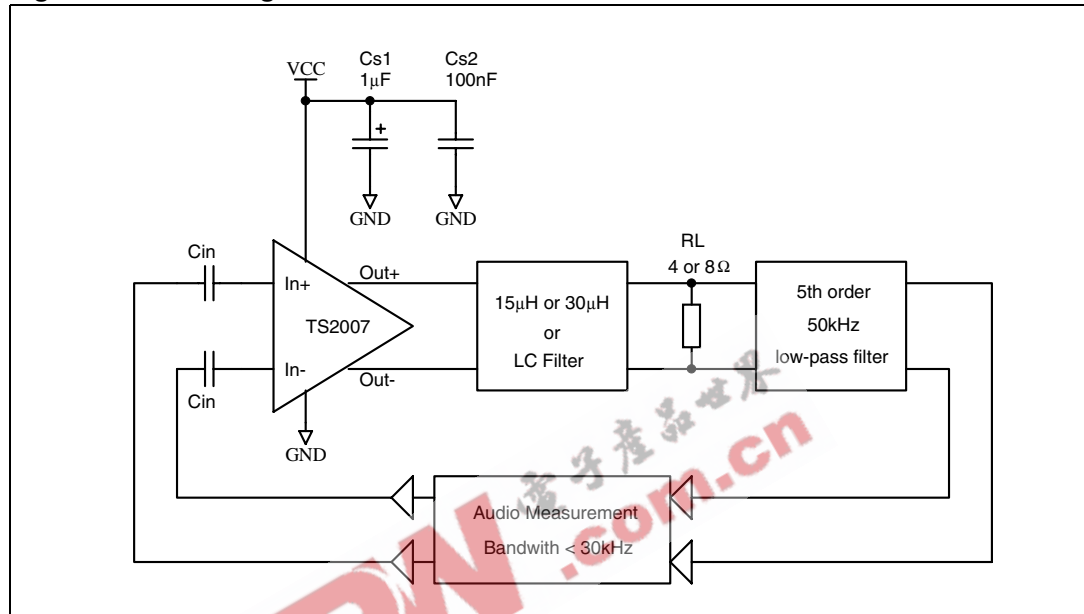

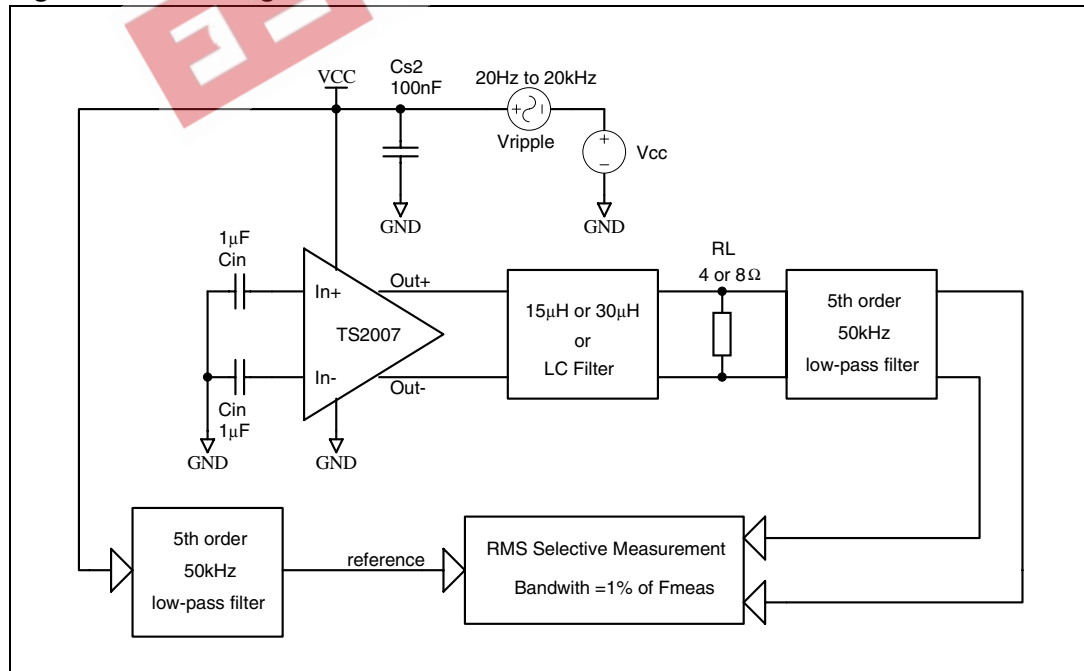

Figure 3. Test diagram for PSRR measurements

For quick reference, a list of the graphs shown in this section is provided in [Table 10](#).

## 4 Application information

### 4.1 Differential configuration principle

The TS2007 is a monolithic fully-differential input/output class D power amplifier. The TS2007 includes a common-mode feedback loop that controls the output bias value to average it at  $V_{CC}/2$  in the range of DC common mode input voltage. This allows the device to always have a maximum output voltage swing, and by consequence, maximize the output power. In addition, as the load is connected differentially compared to a single-ended topology, the output is four times higher for the same power supply voltage.

A fully-differential amplifier has the following **advantages**.

- High PSRR (power supply rejection ratio).
- High CMRR (common mode noise rejection).
- Virtually zero pop without additional circuitry, giving a faster start-up time than conventional single-ended input amplifiers.
- Easy interfacing with differential output audio DACs.
- No input coupling capacitors required since there is a common mode feedback loop.

### 4.2 Gain settings

In the flat region of the frequency-response curve (no input coupling capacitor or internal feedback loop + load effect), the differential gain can be set to either 6 or 12 dB depending on the logic level of the GS pin.

**Table 11. GS pin gains**

GS pin	Gain (dB)	Gain (V/V)
1	6 dB	2
0	12 dB	4

*Note:* Between the GS pin and  $V_{CC}$  there is an internal 300 k $\Omega$  resistor. When the pin is floating the gain is 6 dB. In standby mode, this internal resistor is disconnected (HiZ input).

### 4.3 Common mode feedback loop limitations

As explained previously, the common mode feedback loop allows the output DC bias voltage to be averaged at  $V_{CC}/2$  for any DC common mode bias input voltage.

Due to the  $V_{icm}$  limitation of the input stage (see [Table 2: Operating conditions](#)), the common mode feedback loop can fulfill its role only within the defined range.

### 4.4 Low frequency response

If a low frequency bandwidth limitation is required, it is possible to use input coupling capacitors. In the low frequency region, the input coupling capacitor  $C_{in}$  has a greater effect.  $C_{in}$  and the input impedance  $Z_{in}$  form a first-order high-pass filter with a -3 dB cut-off frequency (see [Table 5](#) to [Table 9](#)).

$$F_{CL} = \frac{1}{2 \cdot \pi \cdot Z_{in} \cdot C_{in}}$$

So, for a desired cut-off frequency  $F_{CL}$  we can calculate  $C_{in}$ :

$$C_{in} = \frac{1}{2 \cdot \pi \cdot Z_{in} \cdot F_{CL}}$$

with  $F_{CL}$  in Hz,  $Z_{in}$  in  $\Omega$  and  $C_{in}$  in F.

The input impedance  $Z_{in}$  is for the whole power supply voltage range, typically 75 k $\Omega$ . There is also a tolerance around the typical value (see [Table 5](#) to [Table 9](#)). With regard to the tolerance, you can also calculate tolerance of the  $F_{CL}$ :

- $F_{CLmax} = 1.103 \cdot F_{CL}$
- $F_{CLmin} = 0.915 \cdot F_{CL}$

## 4.5 Circuit decoupling

A power supply capacitor, referred to as  $C_S$ , is needed to correctly bypass the TS2007.

The TS2007 has a typical switching frequency of 280 kHz and output fall and rise time of less than or equal to 5 ns. Due to these very fast transients, careful decoupling is mandatory.

A 1  $\mu$ F ceramic capacitor is enough, but it must be located very close to the TS2007 in order to avoid any extra parasitic inductance created by a long track wire. Parasitic loop inductance, in relation with  $di/dt$ , introduces overvoltage that decreases the global efficiency of the device and may cause, if this parasitic inductance is too high, a TS2007 breakdown. For filtering low frequency noise signals on the power line, it is recommended to use a capacitor  $C_S$  of at least 1  $\mu$ F.

In addition, even if a ceramic capacitor has an adequate high frequency ESR (equivalent series resistance) value, its current capability is also important. A 0603 size is a good compromise, particularly when a 4  $\Omega$  load is used.

Another important parameter is the rated voltage of the capacitor. A 1  $\mu$ F/6.3 V capacitor used at 5 V, loses about 50% of its value: with a power supply voltage of 5 V, the decoupling value, instead of 1  $\mu$ F, could be reduced to 0.5  $\mu$ F. As  $C_S$  has particular influence on the THD+N in the medium to high frequency region, this capacitor variation becomes decisive. In addition, less decoupling means higher overshoots which can be problematic if they reach the power supply AMR value (6 V).

## 4.6 Wake-up time ( $t_{wu}$ )

When the standby is released to set the device ON, there is a wait of 1 ms typically. The TS2007 has an internal digital delay that mutes the outputs and releases them after this time in order to avoid any pop noise.

*Note:* The gain increases smoothly (see [Figure 42](#) and [Figure 43](#)) from the mute to the gain selected by the GS pin ([Section 4.2](#)).

### 4.7 Shutdown time

When the standby command is set to high, the time required to put the two output stages into high impedance and to put the internal circuitry in shutdown mode, is typically 1 ms. This time is used to decrease the gain and avoid any pop noise during shutdown.

*Note:* The gain decreases smoothly until the outputs are muted (see [Figure 42](#) and [Figure 43](#)).

### 4.8 Consumption in shutdown mode

Between the shutdown pin and GND there is an internal 300 kΩ resistor. This resistor forces the TS2007 to be in shutdown when the shutdown input is left floating.

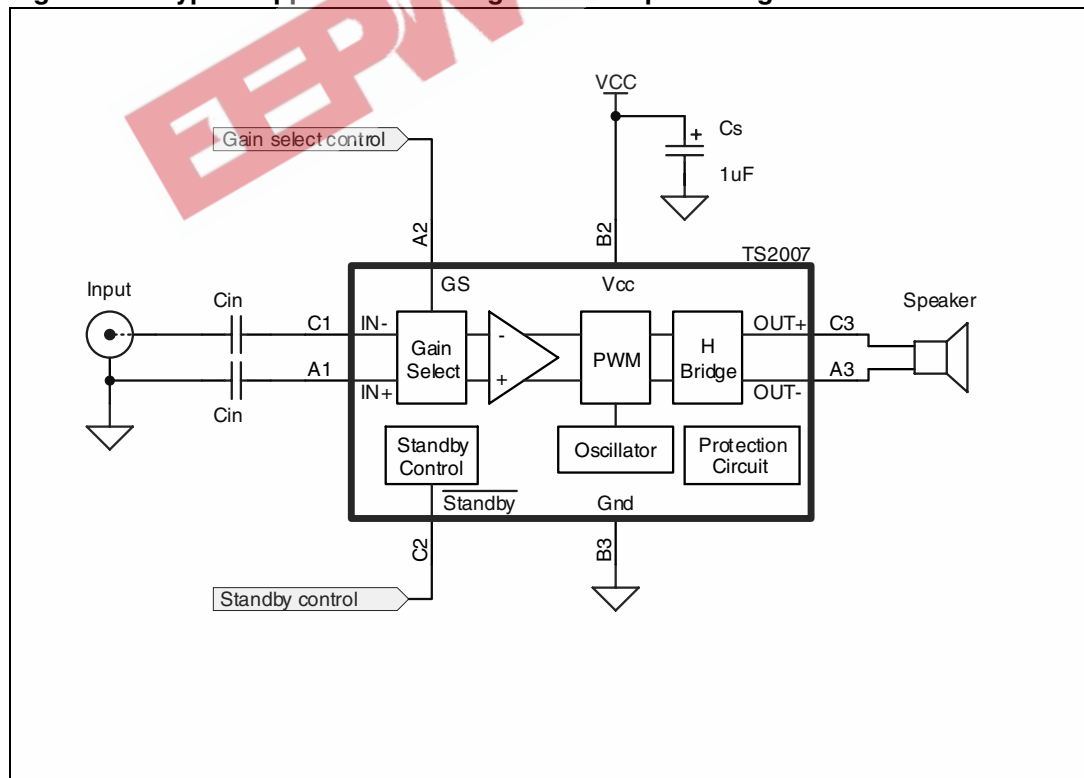

However, this resistor also introduces additional shutdown power consumption if the shutdown pin voltage does not equal 0 V. This extra current is provided by the device that drives the standby pin of the amplifier.

Referring to [Table 2: Operating conditions on page 4](#), with a 0.4 V shutdown voltage pin for example, you must add  $0.4\text{ V}/300\text{ k} = 1.3\text{ }\mu\text{A}$  in typical ( $0.4\text{ V}/273\text{ k} = 1.46\text{ }\mu\text{A}$  maximum) to the shutdown current specified in [Table 5](#) to [Table 9](#).

### 4.9 Single-ended input configuration

It is possible to use the TS2007 in a single-ended input configuration. However, input coupling capacitors are needed in this configuration. The following schematic diagram shows a typical single-ended input application.

**Figure 44. Typical application for single-ended input configuration**

## 4.10 Output filter considerations

The TS2007 is designed to operate without an output filter. However, due to very sharp transients on the TS2007 output, EMI radiated emissions may cause some standard compliance issues.

These EMI standard compliance issues can appear if the distance between the TS2007 outputs and loudspeaker terminal are long (typically more than 50 mm, or 100 mm in both directions). As the PCB layout and internal equipment device are different for each configuration, it is difficult to provide a one-size-fits-all solution.

However, to decrease the probability of EMI issues, there are several simple rules to follow.

- Reduce, as much as possible, the distance between the TS2007 output pins and the speaker terminals.
- Use a ground plane for shielding sensitive wires.
- Place, as close as possible to the TS2007 and in series with each output, a ferrite bead with a rated current of minimum 2.5 A and impedance greater than 50  $\Omega$  at frequencies above 30 MHz.
- Allow extra footprint to place, if necessary, a capacitor to short perturbations to ground ([Figure 45](#)).

**Figure 45. Ferrite chip bead placement**

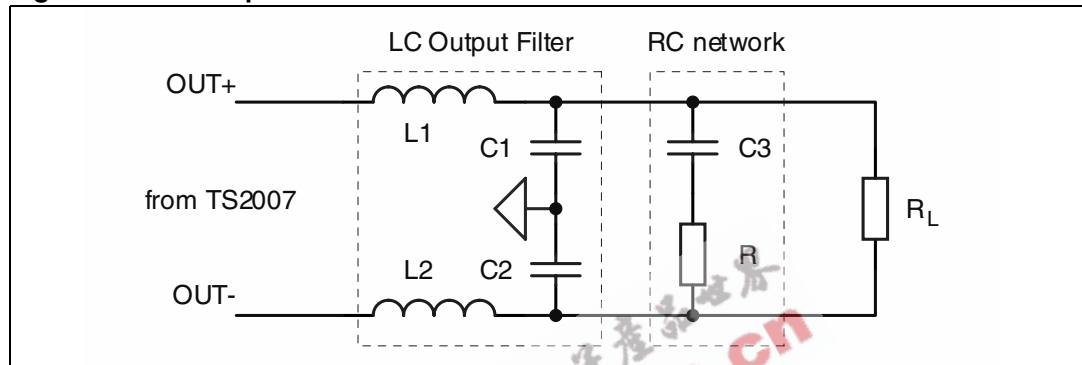

In the case where the distance between the TS2007 output and the speaker terminals is too long, it is possible to have low frequency EMI issues due to the fact that the typical operating PWM frequency is 280 kHz and fall and rise time of the output signal is less than or equal to 5 ns. In this configuration, it is necessary to use the output filter represented in [Figure 46 on page 24](#), that consists of L1, C1, L2 and C2 as close as possible to the TS2007 outputs.

When an output filter is used and there exists a possibility to disconnect a load, it is recommended to use an RC network that consists of C3 and R as shown in [Figure 46 on page 24](#). In this case, when the output filter is connected without any load, the filter acts like a short circuit for input frequencies above 10 kHz. The RC network corrects frequency response of the output filter and compensates this limitation.

**Table 12. Example of component choice**

Component	$R_L = 4 \Omega$	$R_L = 8 \Omega$
L1	15 $\mu$ H / 1.4A	30 $\mu$ H / 0.7A
L2	15 $\mu$ H / 1.4A	30 $\mu$ H / 0.7A
C1	2 $\mu$ F / 10V	1 $\mu$ F / 10V
C2	2 $\mu$ F / 10V	1 $\mu$ F / 10V
C3	1 $\mu$ F / 10V	1 $\mu$ F / 10V
R	22 $\Omega$ / 0.25W	47 $\Omega$ / 0.25W

**Figure 46. LC output filter with RC network**

### 4.11 Short-circuit protection

The TS2007 includes an output short-circuit protection. This protection prevents the device from being damaged if there are fault conditions on the amplifier outputs.

When a channel is in operating mode and a short-circuit occurs directly between two outputs (Out+ and Out-) or between an output and ground (Out+ and GND or Out- and GND), the short-circuit protection detects this situation and puts the amplifier into standby. To put the amplifier back into operating mode, put the standby pin to logical LO and then to logical HI.

### 4.12 Thermal shutdown

The TS2007 device has an internal thermal shutdown protection in the event of extreme temperatures to protect the device from overheating. Thermal shutdown is active when the device reaches 150°C. When the temperature decreases to safe levels, the circuit switches back to normal operation.

## 5 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
