

TC1278/TC1279

3-Pin Reset Monitors for 5V Systems

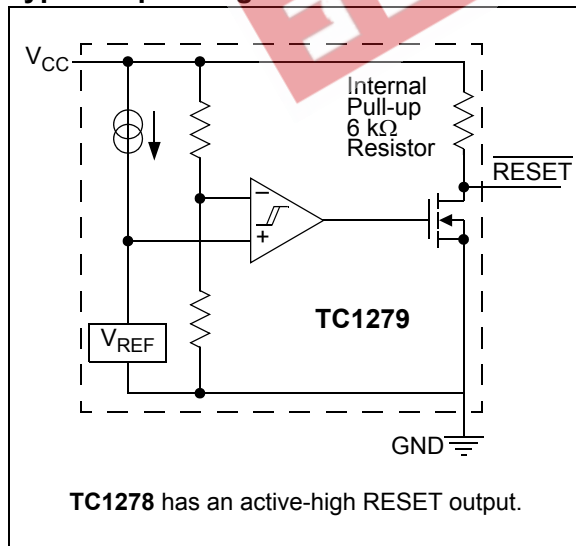

Features

- Precision V_{CC} Monitor for 5.0V System Supplies
- 250 ms Minimum RESET Output Duration
- Output Valid to $V_{CC} = 1.2V$
- V_{CC} Transient Immunity
- Small 3-Pin SOT-23 Package
- No External Components
- Internal Pull-up Resistor
- Available in 3 different voltage detection levels:
 - 4.625V (typ.), -5 suffix
 - 4.375V (typ.), -10 suffix
 - 4.125V (typ.), -15 suffix

Applications

- Computers
- Embedded Systems
- Battery Powered Equipment
- Critical μP Power Supply Monitoring

Typical Operating Circuit

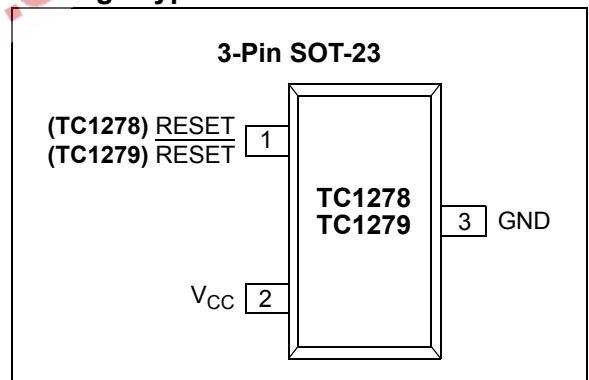

General Description

The TC1278/TC1279 are cost-effective system supervisor circuits designed to monitor V_{CC} in digital systems and provide a reset signal to the host processor when necessary. No external components are required. The open-drain output uses an internal pull-up resistor of approximately 6 k Ω .

The reset output is driven active within 5 μs of V_{CC} falling through the reset voltage threshold. RESET is maintained active for a minimum of 250 ms after V_{CC} rises above the reset threshold. The TC1278 has an active-high RESET output, while the TC1279 has an active-low RESET output, with both devices having an open-drain output stage. The output is valid down to $V_{CC} = 1.2V$. Both devices are available in a 3-Pin SOT-23 package.

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

TABLE 2-1: PIN FUNCTION TABLE

| Pin No. | Symbol | Function |
|---------|---------------------------------------|----------------------------------|
| 1 | $\overline{\text{RESET}}$ (TC1279) | $\overline{\text{RESET}}$ output |
| 1 | RESET (TC1278) | RESET output |
| 2 | V_{CC} | Supply voltage (1.2V to 5.5V). |
| 3 | GND | Ground. |

2.1 $\overline{\text{RESET}}$ (TC1279)

$\overline{\text{RESET}}$ output remains low while V_{CC} is below the reset voltage threshold, and for 350 ms (250 ms min.) after V_{CC} rises above reset threshold. The output stage of the TC1279 is open-drain.

2.2 RESET (TC1278)

RESET output remains high while V_{CC} is below the reset voltage threshold, and for 350 ms (250 ms min.) after V_{CC} rises above reset threshold. The output stage of the TC1278 is open-drain.

2.3 V_{CC}

Supply voltage (1.2V to 5.5V).

2.4 Ground

Device ground.

3.0 APPLICATIONS INFORMATION

3.1 Operation – Power Monitor

The TC1278/TC1279 provide the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When V_{CC} is detected as out-of-tolerance, the RESET signal is asserted. On power-up, RESET is kept active for approximately 350 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before RESET is released.

FIGURE 3-4: TC1278 Power-Down Timing Diagram.

TC1278/TC1279

3.2 V_{CC} Transient Rejection

The TC1278/TC1279 provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions. Furthermore, it rejects negative-going transients (glitches) on the power supply line. Figure 3-5 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive that lays under the curve will not generate a reset signal. Combinations above the curve are detected as a brownout or power-down. Transient immunity can be improved by adding a capacitor in close proximity to the V_{CC} pin of the TC1278/TC1279.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
