

3-Pin Reset Monitors for 3.3V Systems

Features

- Precision V_{CC} Monitor for 3.3V Systems
- 100msec Minimum $\overline{\text{RESET}}$, RESET Output Duration
- Output Valid to $V_{CC} = 1.2V$
- V_{CC} Transient Immunity
- Small 3-Pin SOT-23B Package
- No External Components

Applications

- Computers
- Embedded Systems
- Battery Powered Equipment
- Critical μP Power Supply Monitoring

Device Selection Table

Part Number	Order	Package	Temp. Range
TC1275-xENB	Complimentary	3-Pin SOT-23B	-40°C to +85°C
TC1276-xENB	Open Drain	3-Pin SOT-23B	-40°C to +85°C
TC1277-xENB	Complimentary	3-Pin SOT-23B	-40°C to +85°C

NOTE: "x" denotes a suffix for V_{CC} threshold (see table below).

Suffix	Reset V_{CC} Threshold (V)
5	3.06
10	2.88
20	2.55

Package Type

General Description

The TC1275/TC1276/TC1277 are cost-effective system supervisor circuits designed to monitor V_{CC} in digital systems and provide a reset signal to the host processor when necessary. No external components are required.

The reset output is driven active within 20 μsec of V_{CC} falling through the reset voltage threshold. RESET is maintained active for a minimum of 100msec after V_{CC} rises above the reset threshold. The TC1277 has an active-high RESET output while the TC1275 and TC1276 have an active-low $\overline{\text{RESET}}$ output. TC1275 and TC1277 each have a complimentary output while the TC1276 has an open drain output. The output of the TC1275 and TC1276 is valid down to $V_{CC} = 1.2V$. The TC1277 is valid down to $V_{CC} = 1.8V$. All three devices are available in a 3-Pin SOT-23B package.

The TC1275/TC1276/TC1277 devices are optimized to reject fast transient glitches on the V_{CC} line.

Typical Operating Circuit

TC1275/TC1276/TC1277

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Supply Voltage (V_{CC} to GND)	+6.0V
$\overline{\text{RESET}}$, RESET	-0.3V to ($V_{CC} + 0.3V$)
Input Current, V_{CC}	20mA
Output Current, $\overline{\text{RESET}}$, RESET	20mA
Power Dissipation ($T_A \leq 70^\circ\text{C}$)	
3-Pin SOT-23B (derate 4mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)	
.....	230mW
Operating Temperature Range.....	-40°C to $+85^\circ\text{C}$
Storage Temperature Range	-65°C to $+150^\circ\text{C}$

*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

TC1275/TC1276/TC1277 ELECTRICAL SPECIFICATIONS

Recommended DC Operating Conditions: $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.

- Note**
- 1: All voltages referenced to ground.
 - 2: Measured with $V_{CC} \geq 2.7$ volts.
 - 3: Measured with $\overline{\text{RESET}}$ output open for TC1275/TC1276; measured with RESET output open for TC1277.
 - 4: $t_R = 5\mu\text{sec}$.
 - 5: A 1k Ω external resistor may be required in some applications for proper operation of the microprocessor reset control circuit when using the TC1276.

TC1275/TC1276/TC1277

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Pin No. (3-Pin SOT-23B)	Symbol	Description
1	$\overline{\text{RESET}}$ (TC1275/ TC1276)	$\overline{\text{RESET}}$ output remains low while V_{CC} is below the reset voltage threshold, and for 200msec (100msec min.) after V_{CC} rises above reset threshold. The output stage of the TC1275 is complimentary. The output stage of the TC1276 is open drain.
1	RESET (TC1277)	RESET output remains high while V_{CC} is below the reset voltage threshold, and for 200msec (100msec min.) after V_{CC} rises above reset threshold. The output stage of the TC1277 is complimentary.
2	V_{CC}	Supply voltage (1.2V to 5.5V TC1275 and TC1276, 1.8V to 5.5V TC1277).
3	GND	Ground.

TC1275/TC1276/TC1277

3.0 APPLICATIONS INFORMATION

3.1 Operation – Power Monitor

The TC1275/TC1276/TC1277 provide the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When V_{CC} is detected as out-of-tolerance, the RESET signal is asserted. On power-up, RESET is kept active for approximately 200msec after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before RESET is released.

FIGURE 3-1: Timing Diagram – Power Up (TC1275/TC1276)

FIGURE 3-2: Timing Diagram – Power Down (TC1275/TC1276)

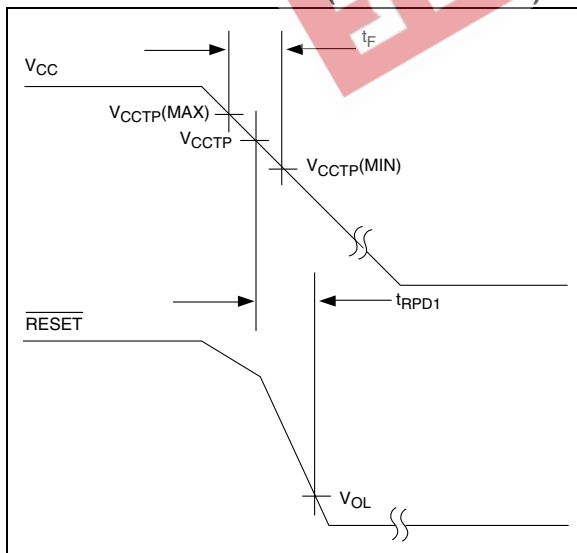

FIGURE 3-3: Timing Diagram – Power Up (TC1277)

FIGURE 3-4: Timing Diagram – Power Down (TC1277)

TC1275/TC1276/TC1277

3.2 V_{CC} Transient Rejection

The TC1275/TC1276/TC1277 provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative-going transients (glitches) on the power supply line. Figure 3-5 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive that lays **under** the curve will **not** generate a reset signal. Combinations above the curve are detected as a brownout or power-down. Transient immunity can be improved by adding a capacitor in close proximity to the V_{CC} pin of the TC1275/TC1276/TC1277.

3.3 $\overline{\text{RESET}}$ Signal Integrity During Power-Down

The TC1275 $\overline{\text{RESET}}$ output is valid to $V_{CC} = 1.2V$. Below this voltage the output becomes an "open circuit" and does not sink current. This means CMOS logic inputs to the μP will be floating at an undetermined voltage. Most digital systems are completely shut down well above this voltage. However, in situations where $\overline{\text{RESET}}$ must be maintained valid to $V_{CC} = 0V$, a pull-down resistor must be connected from $\overline{\text{RESET}}$ to ground to discharge stray capacitances and hold the output low (Figure 3-6). This resistor value, though not critical, should be chosen such that it does not appreciably load $\overline{\text{RESET}}$ under normal operation (100k Ω will be suitable for most applications). Similarly, a pull-up resistor to V_{CC} is required for the TC1277 to ensure a valid high $\overline{\text{RESET}}$ for V_{CC} below 1.8V.

FIGURE 3-5: MAXIMUM TRANSIENT DURATION VS. OVERDRIVE FOR GLITCH REJECTION AT 25°C

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.
