## 4-bit arithmetic logic unit

### FEATURES

- Provides 16 arithmetic operations: add, subtract, compare, and double; plus 12 other arithmetic operations
- Provides all 16 logic operations of two variables: Exclusive-OR, Compare, AND, NAND, NOR, OR, plus 10 other logic operations
- Full look-ahead Carry for high-speed arithmetic operation on long words
- Output capability:  $\pm 24$  mA
- CMOS (AC) and TTL (ACT) voltage level inputs
- 50 $\Omega$  incident wave switching
- Center-pin  $V_{CC}$  and ground configuration to minimize high-speed switching noise
- $I_{CC}$  category: MSI

### DESCRIPTION

The 74AC/ACT1181 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT1181 arithmetic logic units (ALU) are controlled by the four Function Select inputs ( $S_0 - S_3$ ) and the Mode Control input (M) and can perform

### QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS $T_{amb} = 25^\circ\text{C}; \text{GND} = 0\text{V};$ $V_{CC} = 5.0\text{V}$	TYPICAL		UNIT

#### Note:

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz,  $C_L$  = output load capacitance in pF,

$f_o$  = output frequency in MHz,  $V_{CC}$  = supply voltage in V,

$\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of outputs

all the 16 possible logic operations or 16 different arithmetic operations on active-High or active-Low operands. The Function Tables list these operations.

When the Mode Control input (M) is High, all internal carries are inhibited and the device performs logic operation

tions on the individual bits as listed. When the Mode Control input is Low, the carries are enabled and the device performs arithmetic operations on the two 4-bit words. The device incorporates full internal carry look-ahead and provides for either ripple carry between devices using the  $C_{n+4}$  output, or for carry look-ahead between packages using the signals  $\bar{P}$  (Carry Propagate) and  $\bar{G}$  (Carry Generate).  $\bar{P}$  and  $\bar{G}$  are not affected by carry in. When speed requirements are not stringent, it can be used in a simple ripple carry mode by connecting the Carry output ( $C_{n+4}$ ) signal to the Carry input ( $C_n$ ) of the next unit. For high-speed operation the device is used in conjunction with the 74AC/ACT11882 carry look-ahead circuit. One carry look-ahead package is

required for each group of eight 74AC/ACT11181 devices. Carry look-ahead can be provided at various levels and offers high-speed capability over extremely long word lengths.

The  $A = B$  output from the device goes High when all four  $\bar{F}$  outputs are High and can be used to indicate logic equivalence over 4 bits when the unit is in the subtract mode. The  $A = B$  output is open-collector and can be wired-AND with other  $A = B$  outputs to give a comparison for more than 4 bits. The  $A = B$  signal can also be used with the  $C_{n+4}$  signal to indicate  $A > B$  and  $A < B$ .

The Function Tables list both the arithmetic operations that are performed without a carry in and with a carry in.

Note that a carry adds a one to each operation. Thus, select code LHHH generates  $A$  minus  $B$  minus 1 (two's complement notation) without a carry in and generates  $A$  minus  $B$  when a carry is applied. Because subtraction is actually performed by complementary addition (one's complement), a carry out means borrow; thus a carry is generated when there is no underflow and no carry is generated when there is underflow.

As indicated, this device can be used with either active-Low inputs producing active-Low outputs or with active-High inputs producing active-High outputs. For either case, the tables list the operations that are performed to the operands labeled inside the logic symbol.

## PIN DESCRIPTION

PIN NUMBER	SYMBOL	NAME AND FUNCTION
2	M	Mode control input
28, 27, 26, 25	$\bar{A}_0 - \bar{A}_3$	$\bar{A}$ operand inputs
24, 23, 20, 19	$\bar{B}_0 - \bar{B}_3$	$\bar{B}$ operand inputs
18, 17, 16, 15	$S_0 - S_3$	Function select inputs
1	$C_n$	Carry input
14	$C_{n+4}$	Carry output
3	$A = B$	Compare output
4, 5, 10, 11	$\bar{F}_0 - \bar{F}_3$	Outputs
13	$\bar{G}$	Carry generate output
12	$\bar{P}$	Carry propagate output
6, 7, 8, 9	GND	Ground (0V)
21, 22	$V_{CC}$	Positive supply voltage

The 74AC/ACT11181 devices will accommodate active-High or active-Low data if the pin designations are interpreted as follows:

## NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

DEFINITIONS

- $C_L$  = Load capacitance, 50pF; includes jig and probe capacitance
- $R_L$  = Load resistor, 500Ω
- $R_T$  = Termination resistance should be equal to  $Z_{OUT}$  of pulse generators
- Input pulses: PRR ≤ 10MHz
- $t_r = t_f = 3ns$
