DESCRIPTION

The P4C168, P4C169 and P4C170 are a family of 16,384-bit ultra high-speed static RAMs organized as 4K x 4. All three devices have common input/output ports. The P4C168 enters the standby mode when the chip enable (\overline{CE}) control goes HIGH; with CMOS input levels, power consumption is only 83mW in this mode. Both the P4C169 and the P4C170 offer a fast chip select access time that is only 67% of the address access time. In addition, the P4C170 includes an output enable (\overline{OE}) control to eliminate data bus contention. The RAMs operate from a single 5V ± 10% tolerance power supply.

Access times as fast as 12 nanoseconds are available, permitting greatly enhanced system operating speeds. CMOS is used to reduce power consumption to a low 715 mW active, 193 mW standby.

The P4C168 and P4C169 are available in 20-pin (P4C170 in 22-pin) 300 mil DIP packages providing excellent board level densities. The P4C168 is also available in 20-pin 300 mil SOIC, SOJ, CERPACK, and Flat Pack packages.

The P4C169 is also available in a 20-pin 300 mil SOIC package.

- 7. ADDRESS must be valid prior to, or coincident with $\overline{CE}/\overline{CS}$ transition low. For Fast \overline{CS} , t_{AA} must still be met.
- 8. Transition is measured $\pm 200\text{mV}$ from steady state voltage prior to change, with loading as specified in Figure 1.
- 9. Read Cycle Time is measured from the last valid address to the first transitioning address.

Note:

Because of the ultra-high speed of the P4C168, P4C169 AND P4C170 care must be taken when testing these devices; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A high frequency capacitor of 0.01 μF is also required between V_{CC} and ground.

To avoid signal reflections, proper termination must be used; for example, a 50Ω test environment should be terminated into a 50Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116Ω resistor must be used in series with D_{OUT} to match 166Ω (Thevenin Resistance).
