

# LM78MG/LM79MG 4-Terminal Adjustable Voltage Regulators

April 1991

## LM78MG/LM79MG 4-Terminal Adjustable Voltage Regulators

### General Description

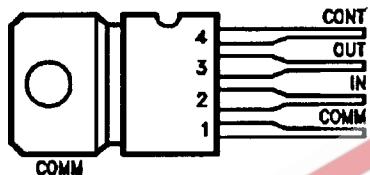

The LM78MG and LM79MG are 4-terminal adjustable voltage regulators. They are designed to deliver continuous load currents of up to 500 mA with a maximum input voltage of +40V for the positive regulator LM78MG and -40V for the negative regulator LM79MG. Output current capability can be increased to greater than 10A through use of one or more external transistors. The output voltage range of the LM78MG positive voltage regulator is 5.0V to 30V and the output voltage range of the negative LM79MG is -30V to -2.6V. For systems requiring both a positive and negative, the LM78MG and LM79MG are excellent for use as a dual tracking regulator.

### Features

- Output current in excess of 0.5A
- LM78MG positive output voltage + 5.0V to + 30V
- LM79MG negative output voltage - 30V to - 2.6V
- Internal thermal overload protection
- Internal short circuit current protection
- Output transistor safe-area protection

## LM79MGC

**Electrical Characteristics**  $0^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$  for LM79MGC,  $V_I = -14\text{V}$ ,  $I_O = 350\text{ mA}$ ,  $C_I = 2.0\text{ }\mu\text{F}$ ,  
 $C_O = 1.0\text{ }\mu\text{F}$ , Test Circuit 2, unless otherwise specified

Symbol	Parameter	Conditions (Notes 1, 3 & 4)	Min	Typ	Max	Units	
$V_{IR}$	Input Voltage Range	$T_J = 25^\circ\text{C}$	-40		-7.0	V	
$V_{OR}$	Output Voltage Range	$V_I = V_O - 5.0\text{V}$	-30		-2.55	V	
$V_O$	Output Voltage Tolerance	$(V_O - 15\text{V}) \leq V_I \leq (V_O - 3.0\text{V})$ , $5.0\text{ mA} \leq I_O \leq 350\text{ mA}$ , $P_D \leq 5.0\text{W}$ , $V_I\text{ Max} = -38\text{V}$	$T_J = 25^\circ\text{C}$		4.0	% ( $V_O$ )	
$V_O\text{ LINE}$	Line Regulation	$T_J = 25^\circ\text{C}$ , $I_O = 200\text{ mA}$ , $V_O \leq -10\text{V}$ , $(V_O - 20\text{V}) \leq V_I \leq (V_O - 2.5\text{V})$ , $T_J = 25^\circ\text{C}$ , $I_O = 200\text{ mA}$ , $V_O \leq -10\text{V}$			5.0		
$V_O\text{ LOAD}$	Load Regulation	$V_I = V_O - 7.0\text{V}$ , $5.0\text{ mA} \leq I_O \leq 500\text{ mA}$ , $T_J = 25^\circ\text{C}$			1.0	%( $V_O$ )	
$I_C$	Control Lead Current	$T_J = 25^\circ\text{C}$			2.0	$\mu\text{A}$	
					3.0		
$I_Q$	Quiescent Current	$T_J = 25^\circ\text{C}$		2.1	7.0	$\text{mA}$	
					8.0		
$RR$	Ripple Rejection	$T_J = 25^\circ\text{C}$ , $I_O = 125\text{ mA}$ , $V_I = -13\text{V}$ , $V_O = -5.0\text{V}$ , $f = 2400\text{ Hz}$	50			dB	
$N_O$	Noise	$10\text{ Hz} \leq f \leq 100\text{ kHz}$ , $V_O = -8.0\text{V}$ , $I_L = 50\text{ mA}$		25	80	$\mu\text{V}/\text{V}_O$	
$V_{DO}$	Dropout Voltage (Note 2)			-1.1	-2.3	V	
$I_{OS}$	Short Circuit Current	$V_I = 35\text{V}$ , $T_J = 25^\circ\text{C}$			600	$\text{mA}$	
$I_{pk}$	Peak Output Current		0.4	0.65	1.4	A	
$\Delta V_O/\Delta T$	Average Temperature Coefficient of Output Voltage	$V_O = -5.0\text{V}$ , $I_O = -5.0\text{ mA}$	$T_A = -55^\circ\text{C}$ to $+25^\circ\text{C}$		0.3	$\text{mV}/^\circ\text{C}/V_O$	
			$T_A = 25^\circ\text{C}$ to $125^\circ\text{C}$		0.3		
$V_C$	Control Lead Voltage (Reference)	$T_J = 25^\circ\text{C}$		-2.65	-2.55	-2.45	V
				-2.68		-2.43	

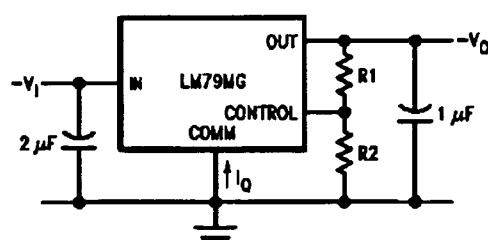

Note 1:  $V_O$  is defined for the LM78MGC as  $V_O = \frac{R_1 + R_2}{R_2}(5.0)$ ; the LM79MGC as  $V_O = \frac{R_1 + R_2}{R_2}(-2.55)$ .

Note 2: Dropout voltage is defined as that input/output voltage differential which causes the output voltage to decrease by 5% of its initial value.

Note 3: All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques ( $t_W \leq 10\text{ ms}$ , duty cycle  $\leq 5\%$ ). Output voltage changes due to changes in internal temperature must be taken into account separately.

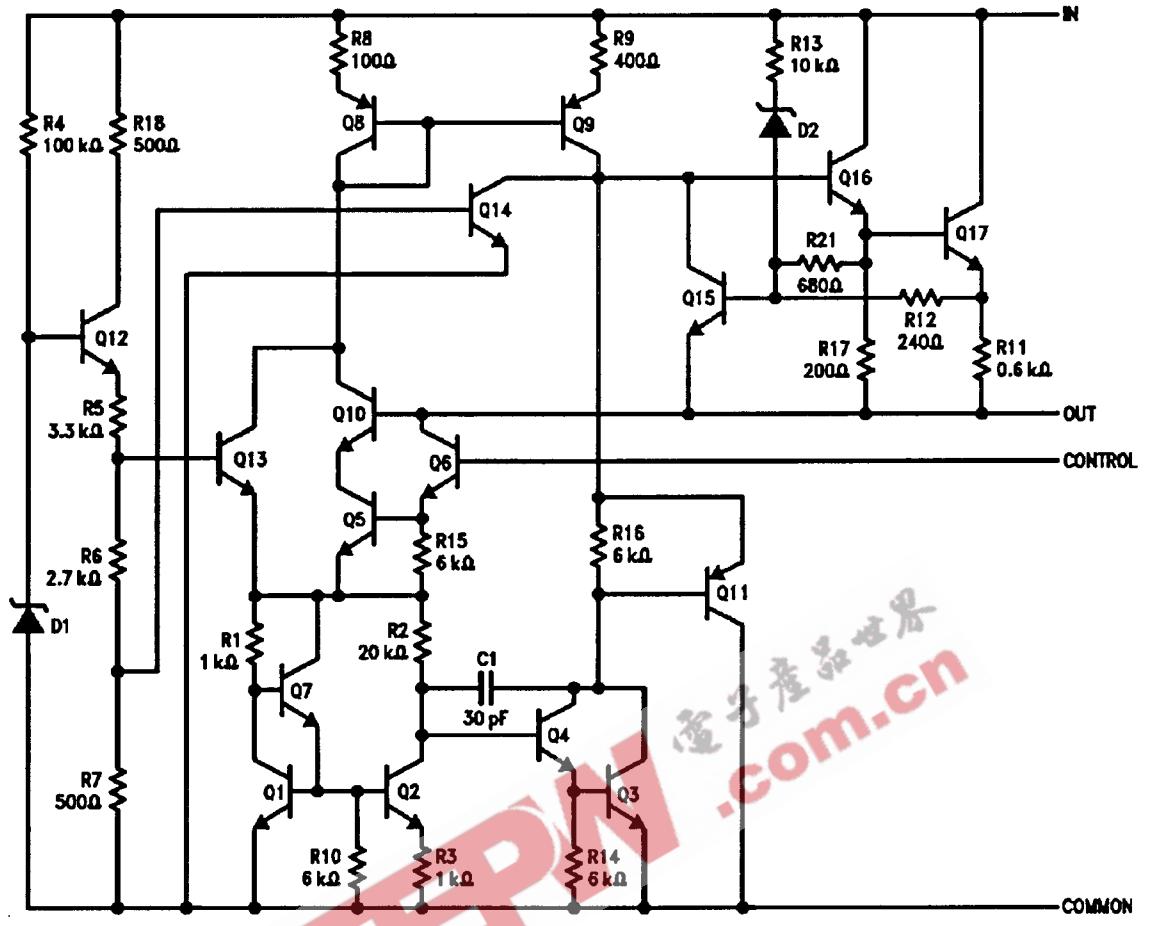

Note 4: The convention for negative regulators is the Algebraic value, thus  $-15\text{V}$  is less than  $-10\text{V}$ .

## Design Considerations

The LM78MG and LM79MG variable voltage regulators have an output voltage which varies from  $V_{CONT}$  to typically

$$V_I - 2.0V \text{ by } V_O = V_{CONT} \frac{(R_1 + R_2)}{R_2}$$

The nominal reference in the LM78MG is 5.0V and LM79MG is -2.55V. If we allow 1.0 mA to flow in the control swing to eliminate bias current effects, we can make  $R_2 = 5 \text{ k}\Omega$  in the LM78MG. The output voltage is then:  $V_O = (R_1 + R_2) \text{ Volts}$ , where  $R_1$  and  $R_2$  are in  $\text{k}\Omega$ .

Example: If  $R_2 = 5.0 \text{ k}\Omega$  and  $R_1 = 10 \text{ k}\Omega$  then

$$V_O = 15\text{V nominal, for the LM78MG;}$$

$$R_2 = 2.6 \text{ k}\Omega \text{ and } R_1 = 13 \text{ k}\Omega \text{ then}$$

$$V_O = -15.3\text{V nominal, for the LM79MG.}$$

By proper wiring of the feedback resistors, load regulation of the devices can be improved significantly.

Both LM78MG and LM79MG regulators have thermal overload protection from excessive power, internal short circuit protection which limits each circuit's maximum current, and output transistor safe-area protection for reducing the output current as the voltage across each pass transistor is increased.

Although the internal power dissipation is limited, the junction temperature must be kept below the maximum specified temperature in order to meet data sheet specifications. To calculate the maximum junction temperature or heat sink required, the following thermal resistance values should be used:

Package	Typ $\theta_{JC}$	Max $\theta_{JC}$	Typ $\theta_{JA}$	Max $\theta_{JA}$
Power Watt	8.0	12.0	70	75

$$P_D \text{ Max} = \frac{T_J \text{ Max} - T_A}{\theta_{JC} + \theta_{CA}}$$

$$\frac{T_J \text{ Max} - T_A}{\theta_{JA}} \text{ (without a heat sink)}$$

$$\theta_{CA} = \theta_{CS} + \theta_{SA}$$

Solving for  $T_J$ :

$$T_J = T_A + P_D(\theta_{JC} + \theta_{CA}) \text{ or}$$

$$T_A + P_D \theta_{JA} \text{ (without heat sink)}$$

Where

$T_J$  = Junction Temperature

$T_A$  = Ambient Temperature

$P_D$  = Power Dissipation

$\theta_{JC}$  = Junction-to-Case Thermal Resistance

$\theta_{CA}$  = Case-to-Ambient Thermal Resistance

$\theta_{CS}$  = Case-to-Heat Sink Thermal Resistance

$\theta_{SA}$  = Heat Sink-to-Ambient Thermal Resistance

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

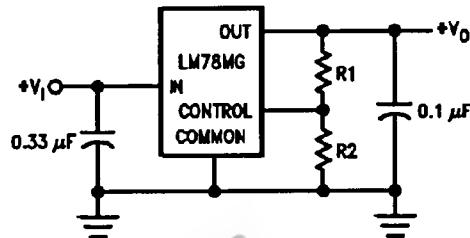

## Typical Applications for LM78MG (Note 1)

Bypass capacitors are recommended for stable operation of the LM78MG over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, (0.33  $\mu\text{F}$  on the input, 0.1  $\mu\text{F}$  on the output) should be ceramic or solid tantalum which have good high frequency characteristics. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

Note 1: All resistor values in ohms.

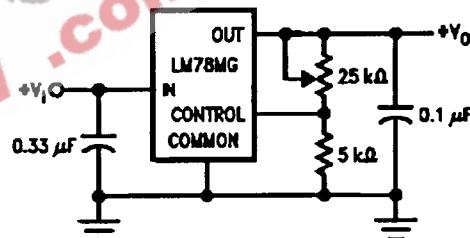

### Basic Positive Regulator

## Typical Applications for LM79MG (Note 1)

Bypass capacitors are recommended for stable operation of the LM79MG over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, (2.0  $\mu$ F on the input, 1.0  $\mu$ F on the output) should be ceramic or solid tantalum which have good high frequency characteristics. If aluminum electrolytics are used, their values should be 10  $\mu$ F or larger. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

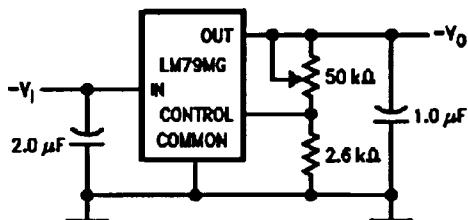

**Basic Negative Regulator**

TL/H/10058-19

$$V_o = -V_{CONT} \left( \frac{R_1 + R_2}{R_2} \right)$$

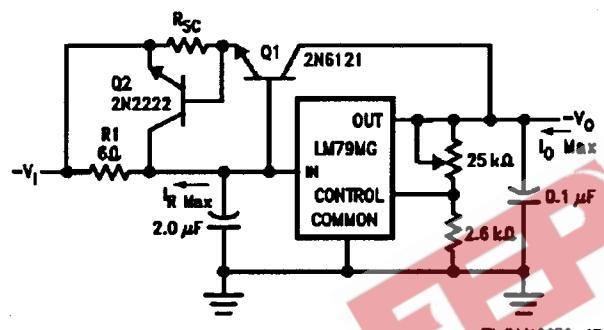

**-30V to -2.6V Adjustable Regulator**

TL/H/10058-21

Note 1: All resistor values in ohms.

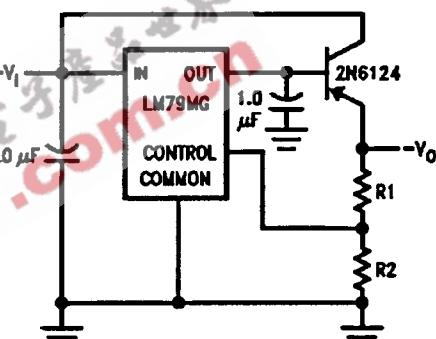

**Negative High Current Short Circuit Protected Regulator**

TL/H/10058-17

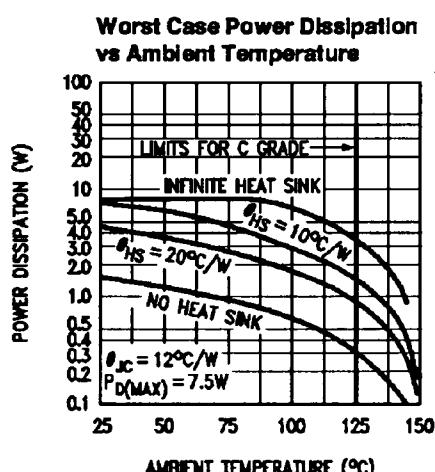

$$R_1 = \frac{\beta V_{BE}(Q1)}{I_R \text{ Max}(\beta) - I_o \text{ Max}}$$

**Negative High Current Voltage Regulator**

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
