## DESCRIPTION:

The IDT29FCT52AT/BT/CT/DT and IDT29FCT53AT/BT/CT are 8-bit registered transceivers built using an advanced dual metal CMOS technology. Two 8-bit back-to-back registers store data flowing in both directions between two bidirectional buses. Separate clock, clock enable and 3-state output enable signals are provided for each register. Both A outputs and B outputs are guaranteed to sink 64mA.

The IDT29FCT52AT/BT/CT/DT and IDT29FCT2052AT/BT/CT are non-inverting options of the IDT29FCT53AT/BT/CT.

The IDT29FCT2052AT/BT/CT has balanced drive outputs with current limiting resistors. This offers low ground bounce, minimal undershoot and controlled output fall times-reducing the need for external series terminating resistors. The IDT29FCT2052T part is a plug-in replacement for IDT29FCT52T part.

## FUNCTIONAL BLOCK DIAGRAM<sup>(1)</sup>

## PIN DESCRIPTION

Name	I/O	Description
A0-7	I/O	Eight bidirectional lines carrying the A Register inputs or B Register outputs.
B0-7	I/O	Eight bidirectional lines carrying the B Register inputs or A Register outputs.
CPA	I	Clock for the A Register. When CEA is LOW, data is entered into the A Register on the LOW-to-HIGH transition of the CPA signal.
CE̅A	I	Clock Enable for the A Register. When CE̅A is LOW, data is entered into the A Register on the LOW-to-HIGH transition of the CPA signal. When CE̅A is HIGH, the A Register holds its contents, regardless of CPA signal transitions.
OE̅B	I	Output Enable for the A Register. When OE̅B is LOW, the A Register outputs are enabled onto the B0-7 lines. When OE̅B is HIGH, the B0-7 outputs are in the high-impedance state.
CPB	I	Clock for the B Register. When CE̅B is LOW, data is entered into the B Register on the LOW-to-HIGH transition of the CPB signal.
CE̅B	I	Clock Enable for the B Register. When CE̅B is LOW, data is entered into the B Register on the LOW-to-HIGH transition of the CPB signal. When CE̅B is HIGH, the B Register holds its contents, regardless of CPB signal transitions.
OE̅A	I	Output Enable for the B Register. When OE̅A is LOW, the B Register outputs are enabled onto the A0-7 lines. When OE̅A is HIGH, the A0-7 outputs are in the high-impedance state.
