DESCRIPTION

The 74LVC109 is a low-voltage Si-gate CMOS device that is pin and function compatible with 74HC/HCT109.

The 74LVC109 is a dual positive-edge triggered JK-type flip-flop featuring individual J, \bar{K} inputs, clock (CP) inputs, set (\bar{S}_D) and reset (\bar{R}_D) inputs; also complementary Q and \bar{Q} outputs.

The set and reset are asynchronous active LOW inputs and operate independently of the clock input.

The J and \bar{K} inputs control the state changes of the flip-flops as described in the mode select function table. The J and \bar{K} inputs must be stable one set-up time prior to the LOW-to-HIGH clock transition for predictable operation. The JK design allows operation as a D-type flip-flop by tying the J and \bar{K} inputs together.

Schmitt-trigger action in the clock input makes the circuit highly tolerant to slower clock rise and fall times.

 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$ where:
f_i = input frequency in MHz; C_L = output load capacity in pF;

 $\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of the outputs.
