## Asynchronous presettable synchronous decade up/down counter with single clock

### FEATURES

- Synchronous, reversible counting
- Positive edge-triggered clock
- BCD/decade
- Asynchronous Parallel Load capability
- Output capability:  $\pm 24\text{mA}$
- CMOS (AC) and TTL (ACT) voltage level inputs
- $50\Omega$  incident wave switching
- Center-pin  $V_{CC}$  and ground configuration to minimize high-speed switching noise
- $I_{CC}$  category: MSI

### DESCRIPTION

The 74AC/ACT11190 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT11190 is an asynchronously presettable up/down BCD decade counter. It contains four master/slave flip-flops with internal gating and steering logic to provide asynchronous preset and synchronous count-up and count-down operation.

### QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS $T_{amb} = 25^\circ\text{C}; \text{GND} = 0\text{V};$ $V_{CC} = 5.0\text{V}$	TYPICAL		UNIT
			AC	ACT	
$t_{PLH}/t_{PHL}$	Propagation delay CP to $Q_n$ ( $\overline{PE} = \text{High}$ )	$C_L = 50\text{pF}$	5.2	7.3	ns
$C_{PD}$	Power dissipation capacitance <sup>1</sup>	$f = 1\text{MHz}; C_L = 50\text{pF}$	68	70	pF
$C_{IN}$	Input capacitance	$V_I = 0\text{V}$ or $V_{CC}$	4.0	4.0	pF
$I_{LATCH}$	Latch-up current	Per JEDEC J40.2 Standard 17	500	500	mA
$f_{MAX}$	Maximum clock frequency; CP $\rightarrow Q_n$	$C_L = 50\text{pF}$	150	120	MHz

#### Note:

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_I + \sum (C_L \times V_{CC}^2 \times f_O) \text{ where:}$$

$f_I$  = input frequency in MHz,  $C_L$  = output load capacitance in pF,

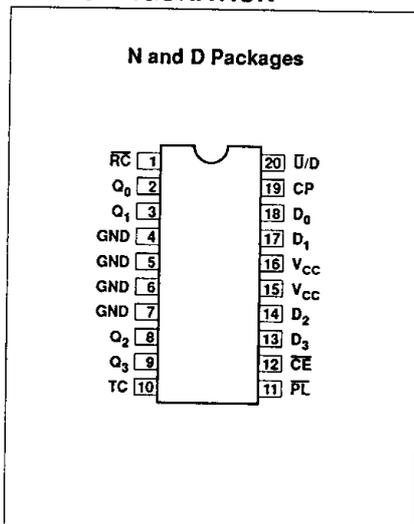

$f_O$  = output frequency in MHz,  $V_{CC}$  = supply voltage in V,

$\sum (C_L \times V_{CC}^2 \times f_O)$  = sum of outputs

## 74AC/ACT11190

Asynchronous Parallel Load capability permits the counter to be preset to any desired number. Information present on the parallel Data inputs ( $D_0 - D_3$ ) is loaded into the counter and appears on the outputs when the Parallel Load (PL) input is Low. As indicated in the Mode Select Table, this operation overrides the counting function.

Counting is inhibited by a High level on the Count Enable ( $\overline{CE}$ ) input.

Overflow/underflow indications are provided by two types of outputs, the Terminal Count (TC) and Ripple Clock (RC). The TC output is normally Low and goes High when: 1) the count reaches zero in the count-down mode or 2) reaches "9" in the Count-up mode. The TC output will remain High until a state change occurs, either by counting or presetting, or until  $\overline{U/D}$  is changed. TC output should not be used as a clock signal because it is subject to decoding spikes. The TC signal is used internally to enable the RC output.

When TC is High and  $\overline{CE}$  is Low, the RC follows the Clock Pulse. The RC output essentially duplicates the Low clock pulse width, although delayed in time by two gate delays. The 74AC/ACT11190 simplifies the design of multistage counters, as indicated in Figures 1a and 1b.

In Figure 1a, each RC output is used as the Clock input for the next higher stage. When the Clock input source has limited drive capability this configuration is particularly advantageous, since the clock source drives only the first stage. It is only necessary to inhibit the first stage to prevent counting in all stages, since a High signal on  $\overline{CE}$  inhibits the RC output pulse as indicated in the Mode Select Table. The timing skew between state changes in the first and last stages is represented by the cumulative delay of the clock as it ripples through the preceding stages. This is a disadvantage of the configuration in some applications.

Figure 1b shows a method of causing state changes to occur simultaneously in all stages. The RC outputs propagate the carry/borrow signals in ripple fashion and all Clock inputs are driven in parallel. The Low state duration of the clock in this configuration must be long enough to allow the negative-going edge of the carry/borrow signal to ripple through to the last stage before the clock goes High. Since the RC output of any package goes High shortly after its CP input goes High, there is no such restriction on the High state duration of the clock.

In Figure 1c, the configuration shown avoids ripple delays and their associated restrictions. Combining the TC signals from all the preceding stages forms the  $\overline{CE}$  input signal for a given stage. An enable signal must be included in each carry gate in order to inhibit counting. The TC output of a given stage is not affected by its own  $\overline{CE}$ , therefore, the simple inhibit scheme of Figure 1a and 1b does not apply.

## NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

## AC WAVEFORMS (Continued)

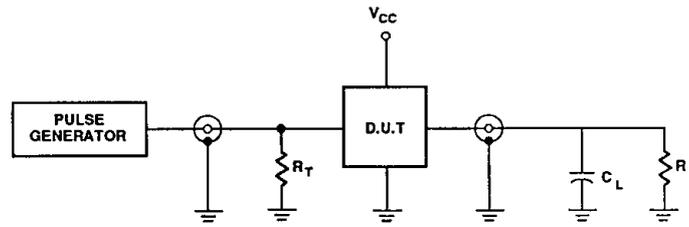

### WAVEFORM CONDITIONS

	INPUTS	OUTPUTS
AC	$V_{IN} = \text{GND to } V_{CC}$ $V_M = 50\% V_{CC}$	$V_{OUT} = V_{OL} \text{ to } V_{OH}$
ACT	$V_{IN} = \text{GND to } 3.0V$ $V_M = 1.5V$	$V_M = 50\% V_{CC}$

#### DEFINITIONS

$C_L$  = Load capacitance, 50pF; includes jig and probe capacitance

$R_L$  = Load resistor, 500 $\Omega$

$R_T$  = Termination resistance should be equal to  $Z_{OUT}$  of pulse generators

Input pulses: PRR  $\leq$  10MHz

$t_r = t_f = 3ns$
