SN54LS56, SN54LS57, SN74LS56, SN74LS57 FREQUENCY DIVIDERS

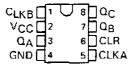

SDLS182

DECEMBER 1983-REVISED MARCH 1988

- 'LS56 Performs 50 to 1 Frequency Division (5 to 1, 5 to 1, and 10 to 1)
- 'LS57 Performs 60 to 1 Frequency Division (6 to 1, 5 to 1, and 10 to 1)
- Available in P or JG package (two P or JG Packages Fit in a Single 16-pin Socket)
- Maximum Clock Frequency 25 MHz Typical

description

These frequency dividers are particularly useful in generating one second or one hour timing pulses from 50 Hz (European standard frequency) or 60 Hz (United States standard frequency). 50 to 1 frequency division is accomplished in the 'LS56 by connecting output Q_A to input CLKB. 60 to 1 frequency division in the 'LS57 is accomplished in the same way. More universal capabilities are evidenced by the 25 MHz typical fmax and the almost limitless frequency division possibilities when used in cascade. Two 'LS56 packages may be interconnected to give frequency division of 2500 to 1, 625 to 1,100 to 1, etc. Two 'LS57 packages can be connected to generate frequency divisions of 3600 to 1, 1800 to 1, 900 to 1 etc.

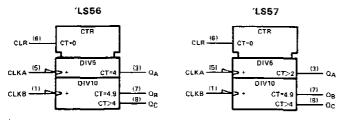

The 'LS56 and 'LS57 frequency dividers consist of three separate counters, A, B, and C on a single monolithic substrate. The A counter divides by 5 to 1 in the 'LS56 and by 6 to 1 in the 'LS57. The B counter divides by 5 to 1 in both devices and is internally tied to the C counter which divides by 2 to 1. The resulting C counter output is 10 to 1. Both the 'LS56 and 'LS57 feature a clear pin which is common to all three counters, A, B, and C. When the clear pin is low, the counters are enabled. When the clear is high, the counters are disabled and their outputs are set to a low-level.

All three counters, A, B, and C trigger on the high-to-low transition of the clock input. All output waveforms are symmetrical except for the 5 to 1 outputs (A and B of the 'LS56 and B of the 'LS57). See the output waveform drawings below.
