74VCXH162240

Low Voltage 16-Bit Inverting Buffer/Line Driver with Bushold and 26 Ω Series Resistors in Outputs

General Description

The VCXH162240 contains sixteen inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is nibble (4-bit) controlled. Each nibble has separate 3-STATE control inputs which can be shorted together for full 16-bit operation.

The VCXH162240 data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating data inputs at a valid logic level.

The 74VCXH162240 is also designed with 26Ω series resistors in the outputs. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers/transmitters.

The 74VCXH162240 is designed for low voltage (1.65V to 3.6V) V_{CC} applications with output capability up to 3.6V.

The 74VCXH162240 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

Features

- 1.65V–3.6V V_{CC} supply operation
- 3.6V tolerant control inputs and outputs
- Bushold on data inputs eliminating the need for external pull-up/pull-down resistors
- 26Ω series resistors in outputs
- too
 - 3.3 ns max for 3.0V to 3.6V $V_{\rm C}$
 - 3.8 ns max for 2.3V to 2.7V V_{CO}
 - 7.6 ns max for 1.65V to 1.95V V_{CC}
- Static Drive (I_{OH}/I_{OL})
 - ±12 mA @ 3.0V V_{CC}
 - ± 8 mA $\,$ @ 2.3V $\,$ V $_{CC}$
 - ±3 mA @ 1.65V V_{CC}
- Uses patented noise/EMI reduction circuitry
- Latch-up performance exceeds 300 mA
- ESD performance:

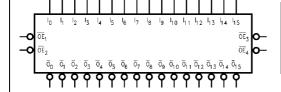

Human body model > 2000V Machine model > 200V

Functional Description

The 74VCXH162240 contains sixteen inverting buffers with 3-STATE outputs. The device is nibble (4 bits) controlled with each nibble functioning identically, but independent of each other. The control pins may be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by an Output Enable (\overline{OE}_n) input. When \overline{OE}_n is LOW, the outputs are in the 2-state mode. When \overline{OE}_n is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs.

 $V_{CC} = 1.65V \text{ to } 2.3V$ ±3 mA Free Air Operating Temperature (T_A) -40°C to +85°C

Minimum Input Edge Rate (Δt/ΔV)

 $V_{IN} = 0.8V$ to 2.0V, $V_{CC} = 3.0V$ 10 ns/V

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: I_O Absolute Maximum Rating must be observed.

Note 4: Floating or unused control inputs must be held HIGH or LOW.

DC Electrical Characteristics (2.7V < $V_{CC} \le 3.6V)$

Symbol	Parameter		Conditions	V _{CC} (V)	Min	Max	Units
