Description

The Bulletin 700-HA General Purpose Relays have pin-style terminals and are available in 2-pole (DPDT) or 3-pole (3PDT). They feature a standard ON/OFF flag indicator, and can be ordered with an optional push-to-test operator, a LED, and bifurcated or gold bifurcated contacts. Coils are available in a wide range of AC and DC voltages. Contacts are rated up to 10 A.

Conformity to Standards:

- EN 60947-4-1
- EN 60947-5-1
- IEC 947
- CSA 22.2
- UL 508
- NEMA/EE MAC compliant
- ICS-2 compliant

Approvals:

- cURus Recognized, File E3125 Guide NLDX 2
- cULus Listed, with Allen-Bradley socket
- CE Marked (per EU Low Voltage Directive 73/23 EEC 93/68 EEC)
- ABS (American Bureau of Shipping), File 00-GE195140-PDA
- RINA listed

Your order must include:

- Cat. No. of the plug-in relay plus suffixes of selection options.
- Cat. No. of socket required.
- If required, Cat. No. of any accessories.

Third Party Approval:

- IMQ listed

Terms:
U is Power Input (Steady Green LED)
R is Relay Output
S Control, +A1 Socket, B1 Timer
t is the resulting Time Delay (Flashing Green LED)

1. Power On-Delay

When the input voltage U is applied, the timing delay t begins. The relay contacts R change state after the time delay is complete. The contacts will return to their shelf state when the power U is removed. The terminal $B1$ is not used in this mode.

2. Single Shot — Power On

When the input voltage U is applied, the relay contacts R change state immediately and the timing cycle begins. When the time delay t is complete, the contacts return to shelf state. When the input voltage U is removed, the contacts return to their shelf state. The terminal $B1$ is not used in this mode.

3. Repeat Cycle — Starting with Relay Energized

When the input voltage U is applied, the relay contacts R change state immediately and time delay t begins. When the time delay t is complete, the contacts return to their shelf state for time delay t . This cycle will repeat until the input voltage U is removed. The terminal $B1$ is not used in this mode.

4. Repeat Cycle — Starting with On-Delay

When the input voltage U is applied, the time delay t begins. When the time delay t is complete, the relay contacts R change state for the time delay t . This cycle will repeat until the input voltage U is removed. The terminal $B1$ is not used in this mode.

5. Signal Off-Delay

The input voltage U must be applied continuously. When the control S (wired at $B1$) is energized, the relay contacts R change state. When the control S is de-energized, the delay t begins. When delay t is complete, the contacts R return to their shelf state. If signal S is energized before the time delay t is complete, then the Time Module is reset, the delay begins again, and the relay contacts remain in their energized state. If the input voltage U is removed, the relay contacts R return to their shelf state.

6. Single Shot — Signal Is a Pulse

The input U must be applied continuously. When the Control S (wired to $B1$ terminal) is energized, the relay contacts R change state and the time delay t begins. When the time delay t is completed, the contacts return to their shelf state. If signal S is de-energized before time t is completed, contacts R still stay in their changed state. The input signal S has control again when delay is completed or power reset. If the input voltage U is removed, the relay contacts R return to their shelf state.

7. Single Shot — Signal Off

The input voltage U must be applied continuously. When the control S (wired at $B1$) is energized and then de-energized, the relay contacts R change state for the time delay t . If the control S is pulsed during the time period t , the relay contacts R will not be affected. If the input power is removed, the relay contacts R return to their shelf state.

8. On Delay — Pulse Controlled

The input voltage U must be applied continuously. When the control S (wired at $B1$) is energized, the time delay t begins. When the time delay t is complete, the relay contacts R change state and remain energized until the control S is de-energized. If the input power U is removed the relay contacts R return to their shelf state.
