

M27C256B

256 Kbit (32Kb x 8) UV EPROM and OTP EPROM

- 5V ± 10% SUPPLY VOLTAGE in READ OPERATION
- ACCESS TIME: 45ns
- LOW POWER CONSUMPTION:
 - Active Current 30mA at 5MHz
 - Standby Current 100µA
- PROGRAMMING VOLTAGE: 12.75V ± 0.25V
- PROGRAMMING TIME: 100µs/word
- ELECTRONIC SIGNATURE
 - Manufacturer Code: 20h
 - Device Code: 8Dh

DESCRIPTION

The M27C256B is a 256 Kbit EPROM offered in the two ranges UV (ultra violet erase) and OTP (one time programmable). It is ideally suited for microprocessor systems and is organized as 32,768 by 8 bits.

The FDIP28W (window ceramic frit-seal package) has a transparent lid which allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written to the device by following the programming procedure.

For applications where the content is programmed only one time and erasure is not required, the M27C256B is offered in PDIP28, PLCC32 and TSOP28 (8 x 13.4 mm) packages.

Table 1. Signal Names

| | |
|--------|--------------------------|
| A0-A14 | Address Inputs |
| Q0-Q7 | Data Outputs |
| E-bar | Chip Enable |
| G-bar | Output Enable |
| VPP | Program Supply |
| VCC | Supply Voltage |
| VSS | Ground |
| NC | Not Connected Internally |
| DU | Don't Use |

Table 2. Absolute Maximum Ratings (1)

| Symbol | Parameter | Value | Unit |
|---------------------|-------------------------------------|------------|------|
| T _A | Ambient Operating Temperature (3) | -40 to 125 | °C |
| T _{BIAS} | Temperature Under Bias | -50 to 125 | °C |
| T _{STG} | Storage Temperature | -65 to 150 | °C |
| V _{IO} (2) | Input or Output Voltage (except A9) | -2 to 7 | V |
| V _{CC} | Supply Voltage | -2 to 7 | V |
| V _{A9} (2) | A9 Voltage | -2 to 13.5 | V |
| V _{PP} | Program Supply Voltage | -2 to 14 | V |

Note: 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

2. Minimum DC voltage on Input or Output is -0.5V with possible undershoot to -2.0V for a period less than 20ns. Maximum DC voltage on Output is V_{CC} +0.5V with possible overshoot to V_{CC} +2V for a period less than 20ns.
3. Depends on range.

Table 3. Operating Modes

| Mode | \bar{E} | \bar{G} | A9 | V _{PP} | Q7-Q0 |
|----------------------|-----------------------|-----------------|-----------------|-----------------|----------|
| Read | V _{IL} | V _{IL} | X | V _{CC} | Data Out |
| Output Disable | V _{IL} | V _{IH} | X | V _{CC} | Hi-Z |
| Program | V _{IL} Pulse | V _{IH} | X | V _{PP} | Data In |

Two Line Output Control

Because EPROMs are usually used in larger memory arrays, this product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows:

- the lowest possible memory power dissipation,
- complete assurance that output bus contention will not occur.

For the most efficient use of these two control lines, \bar{E} should be decoded and used as the primary device selecting function, while \bar{G} should be made a common connection to all devices in the array and connected to the READ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is desired from a particular memory device.

Figure 5. Read Mode AC Waveforms

System Considerations

The power switching characteristics of Advance CMOS EPROMs require careful decoupling of the devices. The supply current, I_{CC} , has three segments that are of interest to the system designer: the standby current level, the active current level, and transient current peaks that are produced by the falling and rising edges of \bar{E} . The magnitude of this transient current peaks is dependent on the capacitive and inductive loading of the device at the output. The associated transient voltage peaks can be suppressed by complying with the two line

output control and by properly selected decoupling capacitors. It is recommended that a $0.1\mu\text{F}$ ceramic capacitor be used on every device between V_{CC} and V_{SS} . This should be a high frequency capacitor of low inherent inductance and should be placed as close to the device as possible. In addition, a $4.7\mu\text{F}$ bulk electrolytic capacitor should be used between V_{CC} and V_{SS} for every eight devices. The bulk capacitor should be located near the power supply connection point. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

Programming

When delivered (and after each erasure for UV EPROM), all bits of the M27C256B are in the "1" state. Data is introduced by selectively programming "0"s into the desired bit locations. Although only "0"s will be programmed, both "1"s and "0"s can be present in the data word. The only way to change a '0' to a '1' is by die exposure to ultraviolet

light (UV EPROM). The M27C256B is in the programming mode when V_{PP} input is at 12.75V, G is at V_{IH} and \bar{E} is pulsed to V_{IL}. The data to be programmed is applied to 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL. V_{CC} is specified to be 6.25V ± 0.25 V.

Figure 6. Programming and Verify Modes AC Waveforms

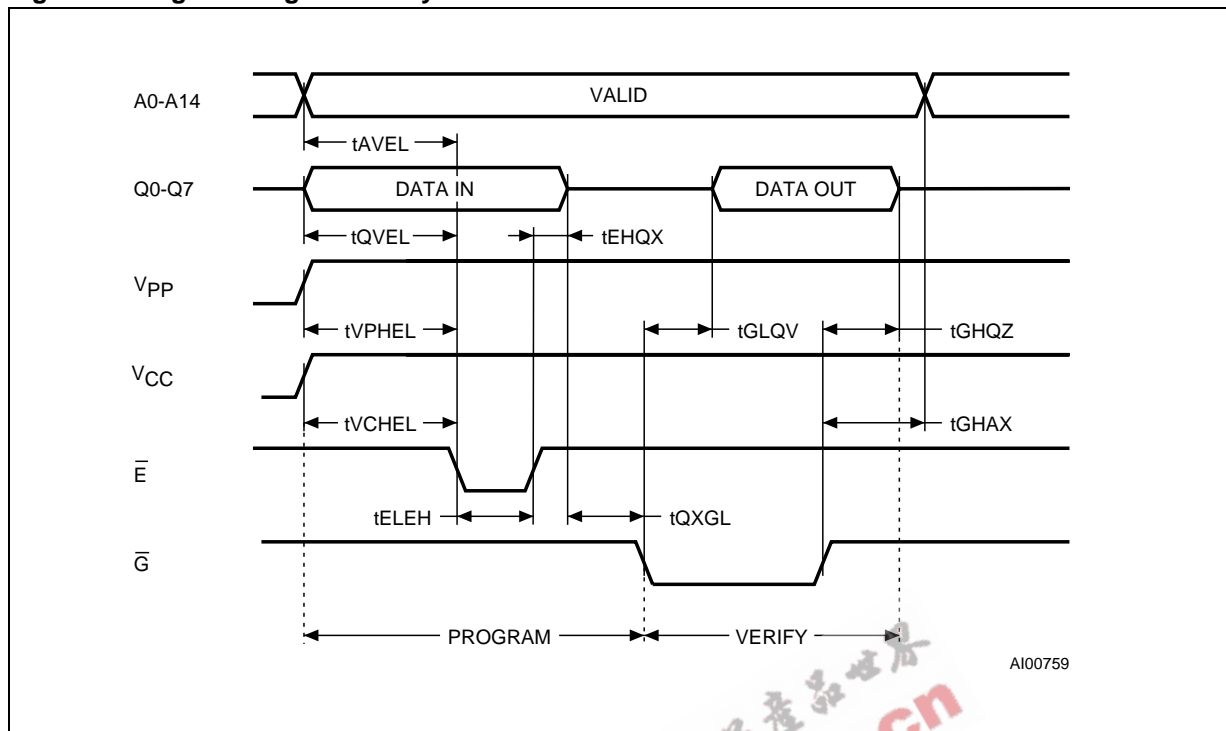

Figure 7. Programming Flowchart

PRESTO II Programming Algorithm

PRESTO II Programming Algorithm allows to program the whole array with a guaranteed margin, in a typical time of 3.5 seconds. Programming with PRESTO II involves the application of a sequence of 100µs program pulses to each byte until a correct verify occurs (see Figure 7). During programming and verify operation, a MARGIN MODE circuit is automatically activated in order to guarantee that each cell is programmed with enough margin. No overprogram pulse is applied since the verify in MARGIN MODE provides necessary margin to each programmed cell.

Program Inhibit

Programming of multiple M27C256Bs in parallel with different data is also easily accomplished. Except for E-bar, all like inputs including G-bar of the parallel M27C256B may be common. A TTL low level pulse applied to a M27C256B's E input, with VPP at 12.75V, will program that M27C256B. A high level E-bar input inhibits the other M27C256Bs from being programmed.

Program Verify

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with G at VIL, E at VIH, VPP at 12.75V and VCC at 6.25V.

Electronic Signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ ambient temperature range that is required when programming the M27C256B. To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M27C256B, with $V_{CC} = V_{PP} = 5\text{V}$. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from V_{IL} to V_{IH} . All other address lines must be held at V_{IL} during Electronic Signature mode. Byte 0 ($A0 = V_{IL}$) represents the manufacturer code and byte 1 ($A0 = V_{IH}$) the device identifier code. For the ST-Microelectronics M27C256B, these two identifier bytes are given in Table 4 and can be read-out on outputs Q7 to Q0.

ERASURE OPERATION (applies for UV EPROM)

The erasure characteristics of the M27C256B is such that erasure begins when the cells are exposed to light with wavelengths shorter than approximately 4000 Å. It should be noted that sunlight and some type of fluorescent lamps have wavelengths in the 3000-4000 Å range. Research shows that constant exposure to room level fluorescent lighting could erase a typical M27C256B in about 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight. If the M27C256B is to be exposed to these types of lighting conditions for extended periods of time, it is suggested that opaque labels be put over the M27C256B window to prevent unintentional erasure. The recommended erasure procedure for the M27C256B is exposure to short wave ultraviolet light which has wavelength 2537Å. The integrated dose (i.e. UV intensity x exposure time) for erasure should be a minimum of 15 W-sec/cm^2 . The erasure time with this dosage is approximately 15 to 20 minutes using an ultraviolet lamp with $12000 \mu\text{W/cm}^2$ power rating. The M27C256B should be placed within 2.5 cm (1 inch) of the lamp tubes during the erasure. Some lamps have a filter on their tubes which should be removed before erasure.
