### DESCRIPTION

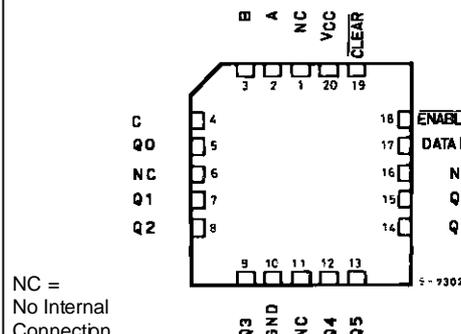

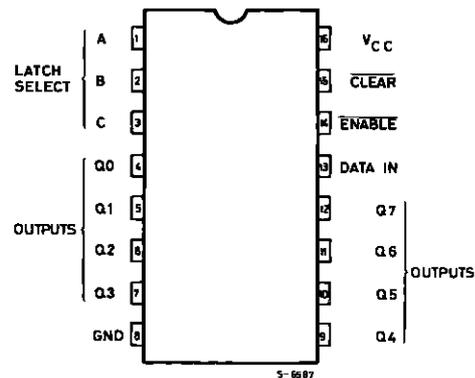

The M54/74HC259 is a high speed CMOS 8 BIT ADDRESSABLE LATCH fabricated in silicon gate C<sup>2</sup>MOS technology. It has the same high speed performance of LSTTL combined with true CMOS low power consumption.

The M54HC259/M74HC259 has single data input (D) 8 latch outputs (Q0-Q7), 3 address inputs (A, B, and C), common enable input (E), and a common CLEAR input. To operate this device as an addressable latch, data is held on the D input, and the address of the latch into which the data is to be entered is held on the A, B, and C inputs. When  $\overline{\text{ENABLE}}$  is taken low the data flows through to the addresses output. The data is stored on the positive-going edge of the  $\overline{\text{ENABLE}}$  pulse. All unaddressed latches will remain unaffected. With  $\overline{\text{ENABLE}}$  in the high state the device is deselected and all latches remain in their previous state, unaffected by changes on the data or address inputs. To eliminate the possibility of entering erroneous data into the latches, the  $\overline{\text{ENABLE}}$  should be held high (inactive) while the address lines are changing. If  $\overline{\text{ENABLE}}$  is held high and  $\overline{\text{CLEAR}}$  is taken low all eight latches are cleared to the low state. If  $\overline{\text{ENABLE}}$  is low all latches except the addressed latch will be cleared. The addressed latch will instead follow the D input, effectively implementing a 3-to 8 line decoder.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.
