DESCRIPTION

The P4C1048L is a 4 Megabit low power CMOS static RAM organized as 512K x 8. The CMOS memory requires no clocks or refreshing, and has equal access and cycle times. Inputs are fully TTL-compatible. The RAM operates from a single 5V±10% tolerance power supply.

Access times as fast as 45 ns are availale. CMOS is utilized to reduce power consumption to a low level.

The P4C1048L device provides asynchronous operation with matching access and cycle times. Memory locations are specified on address pins A_0 to A_{18}. Reading is accomplished by device selection ($\overline{CE}$ low) and output enabling ($\overline{OE}$) while write enable ($\overline{WE}$) remains HIGH. By presenting the address under these conditions, the data in the addressed memory location is presented on the data input/output pins. The input/output pins stay in the HIGH Z state when either $\overline{CE}$ is HIGH or $\overline{WE}$ is LOW.

The P4C1048L is packaged in a 32-pin 445 mil plastic SOP, 32-pin TSOP II, or 600 mil plastic or ceramic side-brazed DIP.

This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.

Note:
Because of the high speed of the P4C1048L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A 0.01 µF high frequency capacitor is also required between V_{CC} and ground.

To avoid signal reflections, proper termination must be used; for example, a 50Ω test environment should be terminated into a 50Ω load with 1.77V (Thevenin Voltage) at the comparator input, and a 589Ω resistor must be used in series with D_{OUT} to match 639Ω (Thevenin Resistance).
