

# PY291A

## 2K x 8 REPROGRAMMABLE PROM

### FEATURES

- EPROM Technology for reprogramming
- High Speed
  - 20/25/35/50 ns (Commercial)
  - 35/50 ns (Military)
- Low Power Operation: 660 mW
- Single 5V±10% Power Supply
- Windowed devices for reprogramming
- Fully TTL Compatible Inputs and Outputs
- Standard Pinout (JEDEC Approved)
  - 24-Pin 300 mil DIP
    - Windowed Cerdip
    - Non-Windowed Cerdip
    - Non-Windowed Plastic Dip

### DESCRIPTION

The PY291A is a 2Kx8 CMOS PROM. The device is available in windowed packages which when exposed to UV light, the memory content in the PROM is erased and can be reprogrammed. EPROM technology is used in the memory cells for programming. The EPROM requires a 12.5V for programming. Devices are tested to insure that performance of the device meets the DC and AC specification limits after customer programming.

To perform a read operation from the device,  $\overline{CS}_1$  is LOW and  $CS_2$  and  $CS_3$  are HIGH. The memory contents in the address established by the Address pins ( $A_0$  to  $A_{10}$ ) will become available on the outputs ( $O_0$  to  $O_7$ ).

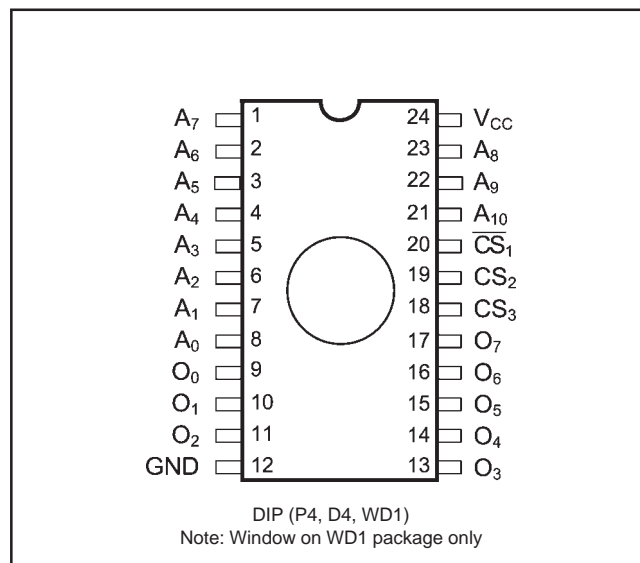

The PY291A is available in 24-pin 300 mil Ceramic DIPs (Cerdip, Windowed and Non-Windowed) and Plastic DIPs (Non-Windowed).

### TIMING WAVEFORM OF READ CYCLE

#### Notes:

1. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
2. Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
3. Transient inputs with  $V_{IL}$  and  $I_{IL}$  not more negative than  $-3.0V$  and  $-100mA$ , respectively, are permissible for pulse widths up to 20ns.
4. This parameter is sampled and not 100% tested.

## DEVICE ERASURE

If the device is subjected to wavelengths of light below 4000 Angstroms, device erasure will commence. It is therefore recommended to use an opaque label over the window in the event the device will be exposed to lighting for a long time. The UV dose for erasure requires a wavelength of 2,537 Angstroms for a minimum dose of

25 Wsec/cm<sup>2</sup>. If using a UV lamp of 12 mW/cm<sup>2</sup>, the exposure time is estimated to be 35 minutes. Devices should be positioned within 1 inch of the lamp during the erasure process. Permanent damage can occur to the devices if exposed to UV light for an extended period of time.

**Note:**

Because of the ultra-high speed of the PY291A, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that

**Figure 2. Thevenin Equivalent**

cause supply bounce must be avoided by bringing the  $V_{CC}$  and ground planes directly up to the contactor fingers. A 0.01  $\mu$ F high frequency capacitor is also required between  $V_{CC}$  and ground.
