

SRAM

128K X 8 HIGH SPEED CMOS STATIC RAM

FEATURES

- Fast Address Access Times : 10/12/15ns
- Single 5V +10% power supply
- Low Power Consumption : 110/105/100mA
- TTL I/O compatible
- 2.0V data retention mode
- Automatic power-down when deselected
- Available packages :
32-pin 300 mil SOJ & 32-pin TSOP-I
- Industry Standard Pin Assignment

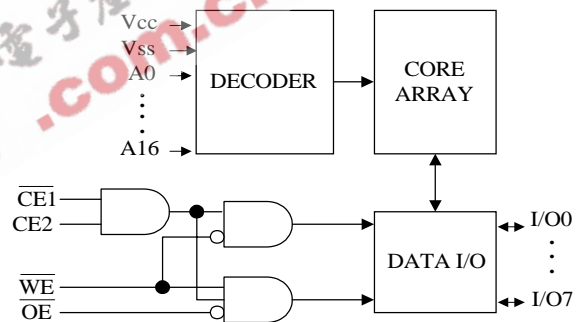

PIN CONFIGURATION

GENERAL DESCRIPTION

The T14M1024A is a one-megabit density, fast static random access memory organized as 131,072 words by 8 bits. It is designed for use in high performance memory applications such as main memory storage and high speed communication buffers. Fabricated using high performance CMOS technology, access times down to 10ns are achieved. Memory expansion by banking is easily accomplished using the chip enable pins $\overline{CE1}$ and $\overline{CE2}$. This device is packaged in a standard 32-pin 300 mil SOJ and 32-pin TSOP-I.

TIMING WAVEFORMS

READ CYCLE 1

(Address Controlled)

READ CYCLE 2

(Chip Enable Controlled)

WRITE CYCLE 1 (\overline{OE} CLOCK)

WRITE CYCLE 2 ($\overline{OE} = V_{IL}$ Fixed)

 DONT CARE
 UNDEFINED

- Notes:
1. During this period, I/O pins are in the output state, so input signals of opposite phase to the outputs should not be applied.
 2. The data output from D_{OUT} are the same as the data written to D_{IN} during the write cycle.
 3. D_{OUT} provides the read data for the next address.
 4. Transition is measured ± 500 mV from steady state with $C_L = 5$ pF. This parameter is guaranteed but not 100% tested.
 5. If \overline{OE} is low during a \overline{WE} controlled write cycle, the write pulse width must be the larger of tWP or $(tWHZ + tDW)$ to allow the I/O drivers to turn off and data to be placed on the bus for the required tDW . If \overline{OE} is high during a \overline{WE} controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified tWP .
