

FEATURES

Pretrimmed to $\pm 0.5\%$ Max 4-Quadrant Error
All Inputs (X, Y and Z) Differential, High Impedance for
 $[(X_1 - X_2)(Y_1 - Y_2)/10] + Z_2$ **Transfer Function**
Scale-Factor Adjustable to Provide up to X10 Gain
Low Noise Design: 90 μV rms, 10 Hz–10 kHz
Low Cost, Monolithic Construction
Excellent Long-Term Stability

APPLICATIONS

High Quality Analog Signal Processing
Differential Ratio and Percentage Computations
Algebraic and Trigonometric Function Synthesis
Accurate Voltage Controlled Oscillators and Filters

PRODUCT DESCRIPTION

The AD632 is an internally-trimmed monolithic four-quadrant multiplier/divider. The AD632B has a maximum multiplying error of $\pm 0.5\%$ without external trims.

Excellent supply rejection, low temperature coefficients and long term stability of the on-chip thin film resistors and buried zener reference preserve accuracy even under adverse conditions. The simplicity and flexibility of use provide an attractive alternative approach to the solution of complex control functions.

The AD632 is pin-for-pin compatible with the industry standard AD532 with improved specifications and a fully differential high impedance Z-input. The AD632 is capable of providing gains of up to X10, frequently eliminating the need for separate instrumentation amplifiers to precondition the inputs. The AD632 can be effectively employed as a variable gain differential input amplifier with high common-mode rejection. The effectiveness of the variable gain capability is enhanced by the inherent low noise of the AD632: 90 μV rms.

PRODUCT HIGHLIGHTS

Guaranteed Performance Over Temperature

The AD632A and AD632B are specified for maximum multiplying errors of $\pm 1.0\%$ and $\pm 0.5\%$ of full scale, respectively at $+25^\circ\text{C}$ and are rated for operation from -25°C to $+85^\circ\text{C}$.

Maximum multiplying errors of $\pm 2.0\%$ (AD632S) and $\pm 1.0\%$ (AD632T) are guaranteed over the extended temperature range of -55°C to $+125^\circ\text{C}$.

High Reliability

The AD632S and AD632T series are also available with MIL-STD-883 Level B screening and all devices are available in either the hermetically-sealed TO-100 metal can or TO-116 ceramic DIP package.

NOTES

¹Figures given are percent of full-scale, ±10 V (i.e., 0.01% = 1 mV).

²May be reduced to 3 V using external resistor between -V_S and SF.

³Irreducible component due to nonlinearity; excludes effect of offsets.

⁴Using external resistor adjusted to give SF = 3 V.

⁵See functional block diagram for definition of sections.

All min and max specifications are guaranteed.

Specifications shown in **boldface** are tested on all production units at final electrical test. Results from those tests are used to calculate outgoing quality levels.

Specifications subject to change without notice.

AD632

Typical Performance Curves

(typical @ +25°C with $\pm V_S = 15\text{ V}$)

Figure 1. AC Feedthrough vs. Frequency

Figure 2. Frequency Response as a Multiplier

Figure 3. Frequency Response vs. Divider Denominator Input Voltage

Figure 4. AD632 Functional Block Diagram

OPERATION AS A MULTIPLIER

Figure 5 shows the basic connection for multiplication. Note that the circuit will meet all specifications without trimming.

Figure 5. Basic Multiplier Connection

In some cases the user may wish to reduce ac feedthrough to a minimum (as in a suppressed carrier modulator) by applying an external trim voltage ($\pm 30\text{ mV}$ range required) to the X or Y input. Curve 1 shows the typical ac feedthrough with this adjustment mode. Note that the feedthrough of the Y input is a factor of 10 lower than that of the X input and should be used in applications where null suppression is critical.

The Z_2 terminal of the AD632 may be used to sum an additional signal into the output. In this mode the output amplifier behaves as a voltage follower with a 1 MHz small signal bandwidth and a 20 V/ μs slew rate. This terminal should always be referenced to the ground point of the driven system, particularly if this is remote. Likewise the differential inputs should be referenced to their respective signal common potentials to realize the full accuracy of the AD632.

A much lower scaling voltage can be achieved without any reduction of input signal range using a feedback attenuator as shown in Figure 6. In this example, the scale is such that $V_{OUT} = XY$, so that the circuit can exhibit a maximum gain of 10. This connection results in a reduction of bandwidth to about 80 kHz without the peaking capacitor C_F . In addition, the output offset voltage is increased by a factor of 10 making external adjustments necessary in some applications.

Feedback attenuation also retains the capability for adding a signal to the output. Signals may be applied to the Z terminal, where they are amplified by -10 , or to the common ground connection where they are amplified by -1 . Input signals may also be applied to the lower end of the $2.7\text{ k}\Omega$ resistor, giving a gain of $+9$.

Figure 6. Connections for Scale-Factor of Unity

OPERATION AS A DIVIDER

Figure 7 shows the connection required for division. Unlike earlier products, the AD632 provides differential operation on both numerator and denominator, allowing the ratio of two floating variables to be generated. Further flexibility results from access to a high impedance summing input to Y_1 . As with all dividers based on the use of a multiplier in a feedback loop, the bandwidth is proportional to the denominator magnitude, as shown in Figure 3.

Figure 7. Basic Divider Connection

Without additional trimming, the accuracy of the AD632B is sufficient to maintain a 1% error over a 10 V to 1 V denominator range (The AD535 is functionally equivalent to the AD632 and has guaranteed performance in the divider and square-rooter configurations and is recommended for such applications).

This range may be extended to 100:1 by simply reducing the X offset with an externally generated trim voltage (range required is $\pm 3.5\text{ mV}$ max) applied to the unused X input. To trim, apply a ramp of $+100\text{ mV}$ to $+V$ at 100 Hz to both X_1 and Z_1 (if X_2 is used for offset adjustment, otherwise reverse the signal polarity) and adjust the trim voltage to minimize the variation in the output.*

Since the output will be near $+10\text{ V}$, it should be ac-coupled for this adjustment. The increase in noise level and reduction in bandwidth preclude operation much beyond a ratio of 100 to 1.

*See the AD535 data sheet for more details.
