DIGITAL DIMMING CONTROL

This is a PWM type digital dimming, which you can control the output current by adjusting the pulse width of the PWM signal.

$$I_{o_set} = I_{o_norm} \times D$$

I_{o_set} refers to the wanted output current value.

I_{o_norm} refers to the rated output current

D refers to the pulse width of the PWM signal

For example: we assume the rated output current is 300mA and wanted output current is 150mA, then the pulse width should be 0.5 from the equation above. That is say if we keep the pulse width of PWM signal at 0.5, the output current will be kept at 150mA. It is natural for the driver to generate a audibly noise in dimming process, because the frequency of the control circuit is within human audibly range (20Hz~20KHz).

TYPICAL APPLICATION CIRCUITS

PWM Dimming control circuit

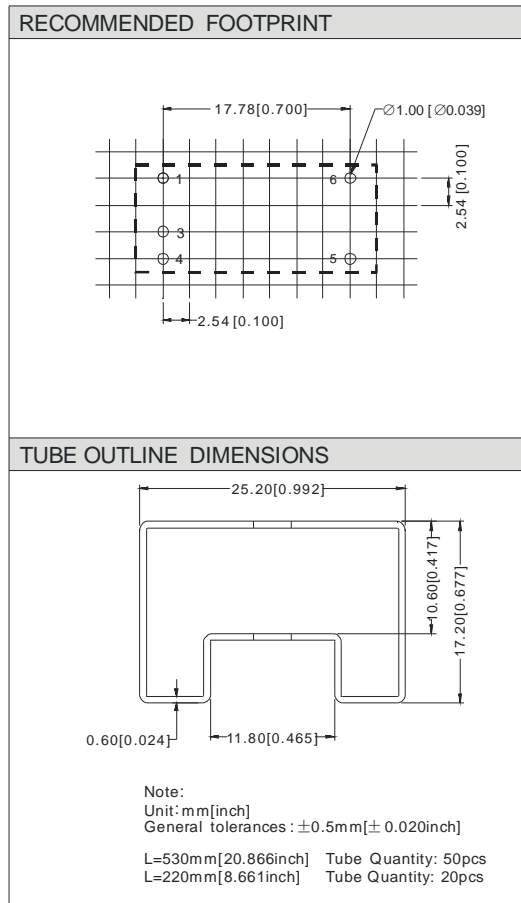

EMI filter circuit

In actual use, if necessary to protect LED, a PTC of positive temperature coefficient may be connect to the input end of every channel or all channels, as shown in Figure 2.
