Note:

- Load regulation is measured for an output change of 20% to 100%.
- The outputs of these units may be connected to provide a 5 VDC, 18 VDC, 24 VDC or 30 VDC output. To do this, connect the load across the positive (+Vout) and negative (-Vout) outputs and float the output common.
- These units do not require external components to operate, but the use of an input capacitor (10 μ F) may enhance performance in some applications. For applications requiring lower output ripple levels, the addition of an output capacitor (4.7 μ F to 10 μ F) will typically achieve good results.
