### DESCRIPTION

The AZP96 is a differential receiver without the input clamping networks found on similar devices such as the AZ100LVEL16. This makes it especially useful as a buffer when input loading effects must be minimized. Removal of the input clamping network means that the output state will be undefined if both inputs are left open.

The AZP96 provides a  $V_{BB}$  output for single-ended use or a DC bias reference for AC coupling to the device. For single-ended input applications, the  $V_{BB}$  reference should be connected to one side of the D/D differential input pair. The input signal is then fed to the other D/D input. The  $V_{BB}$  pin can support 1.5 mA sink/source current. When used, the  $V_{BB}$  pin should be bypassed to ground via a 0.01  $\mu$ F capacitor.

NOTE: Specifications in the ECL/PECL/LVPECL tables are valid when thermal equilibrium is established.

1. Duty cycle skew is the difference between a  $t_{PLH}$  and  $t_{PHL}$  propagation delay through a device.
2.  $V_{PP}$  is the minimum peak-to-peak differential input swing for which AC parameters are guaranteed. The device has a DC gain of  $\approx 40$ .
3. The  $V_{CMR}$  range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{PP}(\min)$  and 1V.
