DAC7625**

## 12-Bit Quad Voltage Output DIGITAL-TO-ANALOG CONVERTER

### FEATURES

- **LOW POWER:** 20mW
- **UNIPOLAR OR BIPOLAR OPERATION**
- **SETTLING TIME:** 10 $\mu$ s to 0.012%
- **12-BIT LINEARITY AND MONOTONICITY:** -40°C to +85°C
- **RESET TO MID-SCALE (DAC7624) OR ZERO-SCALE (DAC7625)**
- **DATA READBACK**
- **DOUBLE-BUFFERED DATA INPUTS**

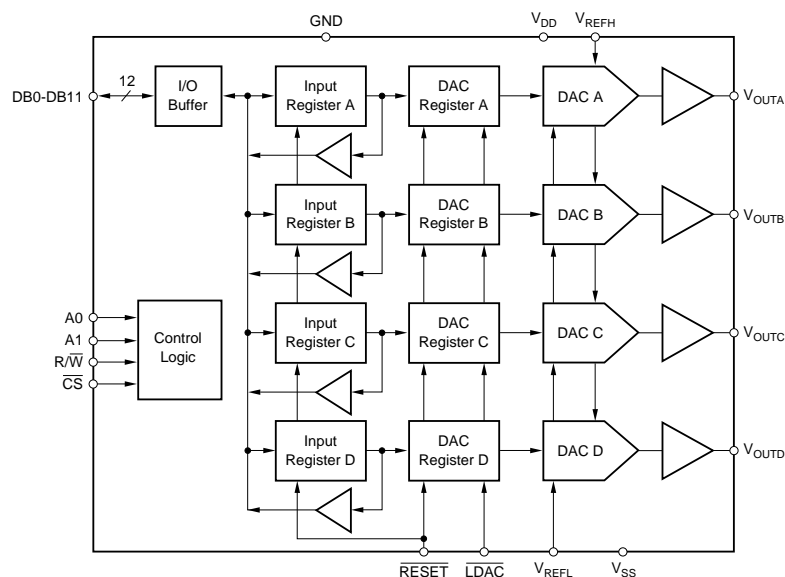

### APPLICATIONS

- **PROCESS CONTROL**
- **ATE PIN ELECTRONICS**
- **CLOSED-LOOP SERVO-CONTROL**
- **MOTOR CONTROL**
- **DATA ACQUISITION SYSTEMS**
- **DAC-PER-PIN PROGRAMMERS**

### DESCRIPTION

The DAC7624 and DAC7625 are 12-bit quad voltage output digital-to-analog converters with guaranteed 12-bit monotonic performance over the specified temperature range. They accept 12-bit parallel input data, have double-buffered DAC input logic (allowing simultaneous update of all DACs), and provide a readback mode of the internal input registers. An asynchronous reset clears all registers to a mid-scale code of 800<sub>H</sub> (DAC7624) or to a zero-scale of 000<sub>H</sub> (DAC7625). The DAC7624 and DAC7625 can operate from a single +5V supply or from +5V and -5V supplies.

Low power and small size per DAC make the DAC7624 and DAC7625 ideal for automatic test equipment, DAC-per-pin programmers, data acquisition systems, and closed-loop servo-control. The DAC7624 and DAC7625 are available in a 28-pin plastic double-wide or a 28-lead SOIC package, and offer guaranteed specifications over the -40°C to +85°C temperature range.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

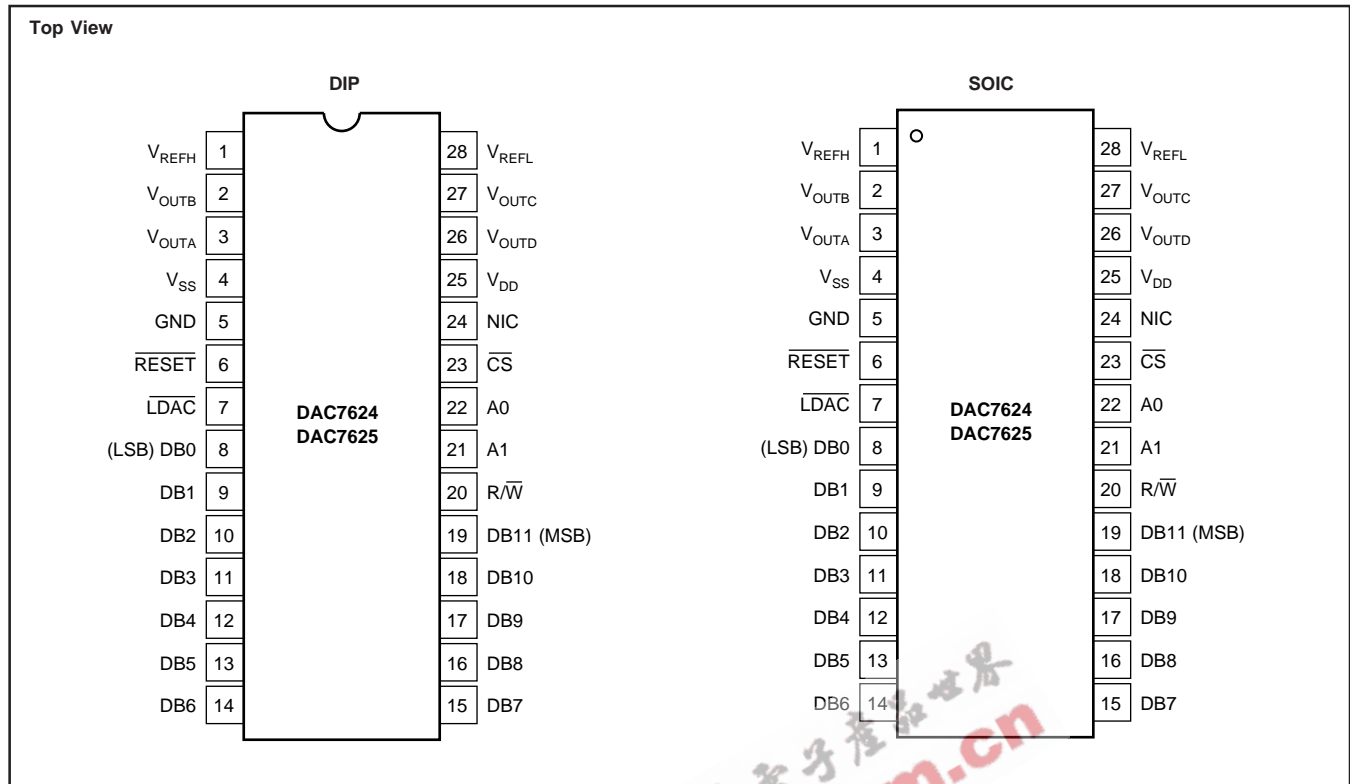

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

# THEORY OF OPERATION

The DAC7624 and DAC7625 are quad, voltage output, 12-bit digital-to-analog converters (DACs). The architecture is a classic R-2R ladder configuration followed by an operational amplifier that serves as a buffer. Each DAC has its own R-2R ladder network and output op-amp, but all share the reference voltage inputs. The minimum voltage output (“zero-scale”) and maximum voltage output (“full-scale”)

are set by the external voltage references ( $V_{REFL}$  and  $V_{REFH}$ , respectively). The digital input is a 12-bit parallel word and the DAC input registers offer a readback capability. The converters can be powered from a single +5V supply or a dual  $\pm 5V$  supply. Each device offers a reset function which immediately sets all DAC output voltages and DAC registers to mid-scale (DAC7624, code 800<sub>H</sub>) or to zero-scale (DAC7625, code 000<sub>H</sub>). See Figures 1 and 2 for the basic operation of the DAC7624/25.

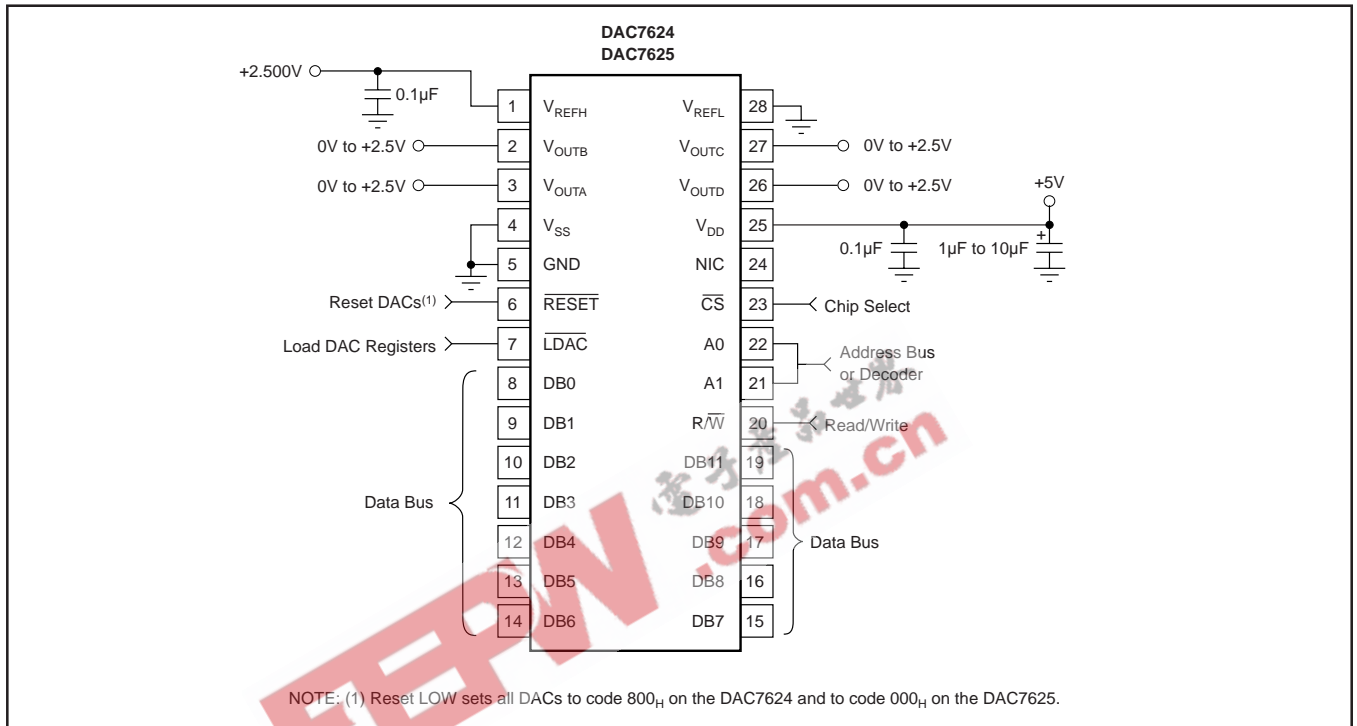

FIGURE 1. Basic Single-Supply Operation of the DAC7624/25.

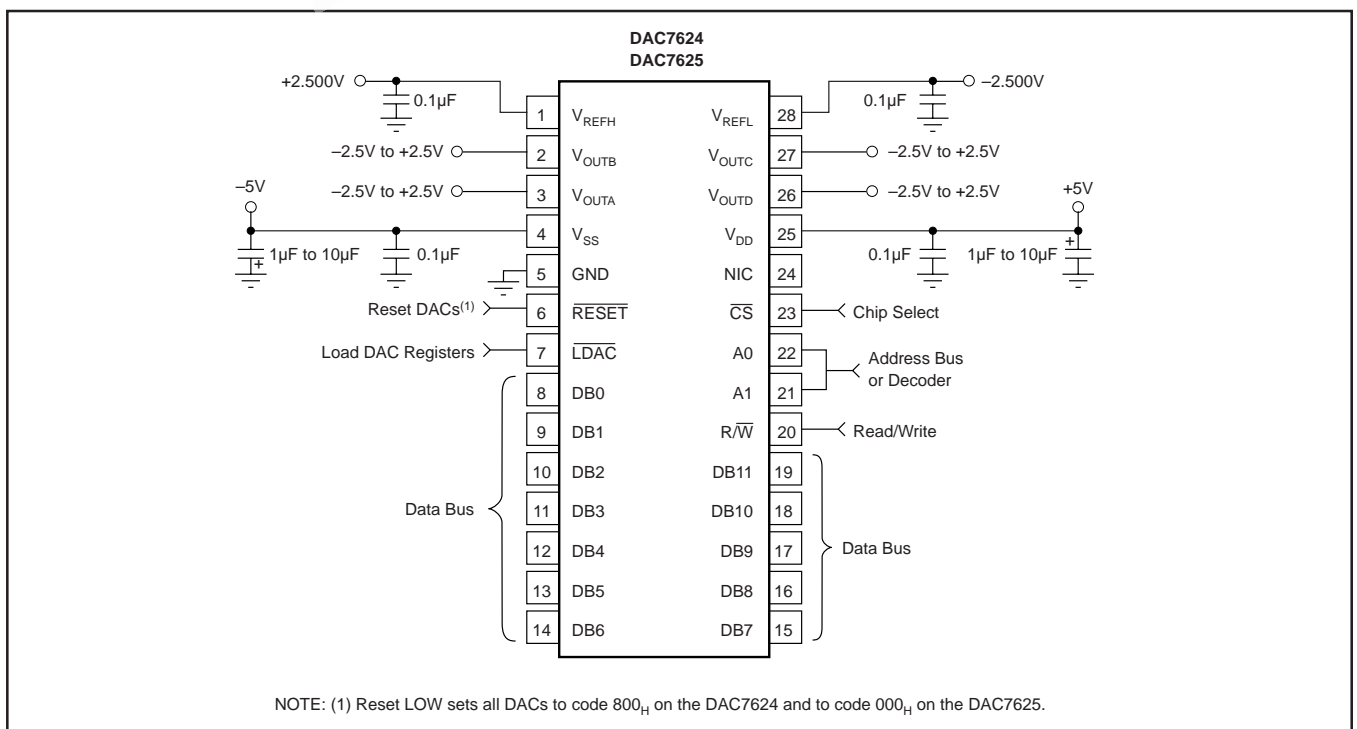

FIGURE 2. Basic Dual-Supply Operation of the DAC7624/25.

## ANALOG OUTPUTS

When  $V_{SS} = -5V$  (dual supply operation), the output amplifier can swing to within 2.25V of the supply rails, guaranteed over the  $-40^{\circ}C$  to  $+85^{\circ}C$  temperature range. With  $V_{SS} = 0V$  (single-supply operation), the output can swing to ground. Note that the settling time of the output op-amp will be longer with voltages very near ground. Also, care must be taken when measuring the zero-scale error when  $V_{SS} = 0V$ . Since the output voltage cannot swing below ground, the output voltage may not change for the first few digital input codes (000<sub>H</sub>, 001<sub>H</sub>, 002<sub>H</sub>, etc.) if the output amplifier has a negative offset.

The behavior of the output amplifier can be critical in some applications. Under short circuit conditions (DAC output shorted to ground), the output amplifier can sink a great deal more current than it can source. See the specification table for more details concerning short circuit current.

## REFERENCE INPUTS

The reference inputs,  $V_{REFL}$  and  $V_{REFH}$ , can be any voltage between  $V_{SS}+2.25V$  and  $V_{DD}-2.25V$  provided that  $V_{REFH}$  is at least 1.25V greater than  $V_{REFL}$ . The minimum output of each DAC is equal to  $V_{REFL}$  plus a small offset voltage (essentially, the offset of the output op-amp). The maximum output is equal to  $V_{REFH}$  plus a similar offset voltage. Note that  $V_{SS}$  (the negative power supply) must either be connected to ground or must be in the range of  $-4.75V$  to  $-5.25V$ . The voltage on  $V_{SS}$  sets several bias points within the converter, if  $V_{SS}$  is not in one of these two configurations, the bias values may be in error and proper operation of the device is not guaranteed.

The current into the  $V_{REFH}$  input depends on the DAC output voltages and can vary from a few microamps to approximately 0.5 milliamp. The  $V_{REFH}$  source will not be required to sink current, only source it. Bypassing the reference voltage or voltages with at least a 0.1uF capacitor placed as close to the DAC7624/25 package is strongly recommended.

## DIGITAL INTERFACE

Table I shows the basic control logic for the DAC7624/25. Note that each internal register is level triggered and not edge triggered. When the appropriate signal is LOW, the register becomes transparent. When this signal is returned HIGH, the digital word currently in the register is latched. The first set of registers (the Input Registers) are triggered via the A0, A1,  $R/\overline{W}$ , and  $\overline{CS}$  inputs. Only one of these registers is transparent at any given time. The second set of registers (the DAC Registers) are all transparent when  $\overline{LDAC}$  input is pulled LOW.

Each DAC can be updated independently by writing to the appropriate Input Register and then updating the DAC Register. Alternatively, the entire DAC Register set can be configured as always transparent by keeping  $\overline{LDAC}$  LOW—the DAC update will occur when the Input Register is written.

The double buffered architecture is mainly designed so that each DAC Input Register can be written at any time and then all DAC voltages updated simultaneously by pulling  $\overline{LDAC}$  LOW. It also allows a DAC Input Register to be written to at any point and the DAC voltage to be synchronously changed via a trigger signal connected to  $\overline{LDAC}$ .

## DIGITAL TIMING

Figure 3 and Table II provide detailed timing for the digital interface of the DAC7624 and DAC7625.

## DIGITAL INPUT CODING

The DAC7624 and DAC7625 input data is in straight binary format. The output voltage is given by the following equation:

$$V_{OUT} = V_{REFL} + \frac{(V_{REFH} - V_{REFL}) \cdot N}{4096}$$

where N is the digital input code. This equation does not include the effects of offset (zero-scale) or gain (full-scale) errors.
