DESCRIPTION

The **HCC 4051B**, **4052B** and **4053B** (extended temperature range) and **HCF4051B**, **4052B** and **4053B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and plastic micropackage. **HCC/HCF4051B**, **HCC/HCF4052B**, and **HCC/HCF4053B** analog multiplexers/demultiplexers are digitally controlled analog switches having low ON impedance and very low OFF leakage

current. These multiplexer circuits dissipate extremely low quiescent power over the full $V_{DD} - V_{SS}$ and $V_{DD} - V_{EE}$ supply-voltage ranges, independent of the logic state of the control signals. When a-logic "1" is present at the inhibit input terminal all channel are off. The **HCC/HCF4051B** is a single 8-channel multiplexer having three binary control inputs, A, B, and C, and an inhibit input. The three binary signals select 1 of 8 channels to be turned on, and connect one of the 8 inputs to the output. The **HCC/HCF4052B** is a differential 4-channel multi-

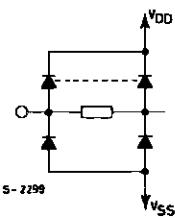

plexer having two binary control inputs, A and B, and an inhibit input. The two binary input signals select 1 of 4 pairs of channels to be turned on and connect the analog inputs to the outputs. The **HCC/HCF4053B** is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a singlepole double-throw configuration.

TYPICAL APPLICATIONS

TYPICAL TIME-DIVISION APPLICATION OF THE 4052B

SPECIAL CONSIDERATIONS

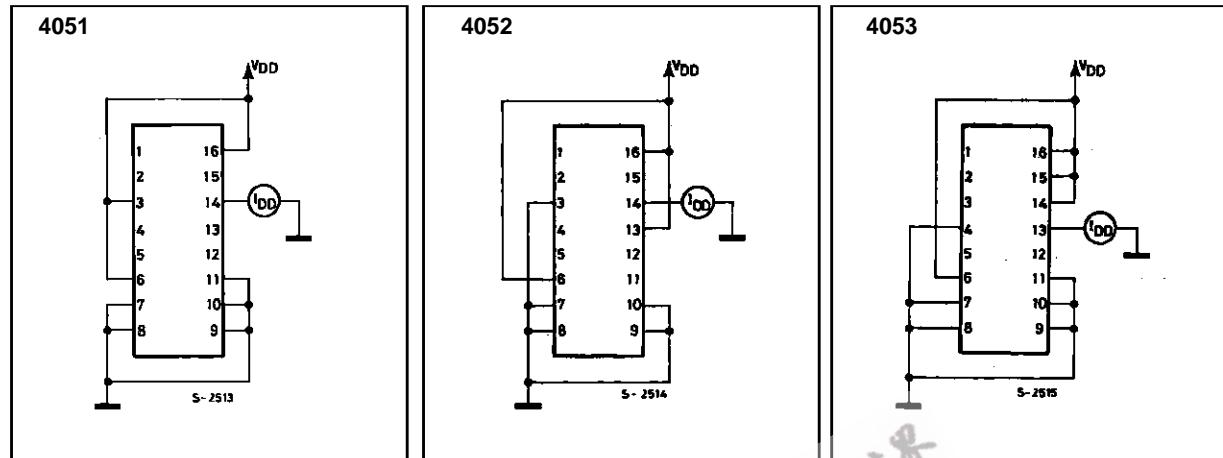

Control of analog signals up to 20V peak-to-peak can be achieved by digital signal amplitudes of 4.5 to 20V (if $V_{DD} - V_{SS} = 3V$, a $V_{DD} - V_{EE}$ of up to 13V can be controlled ; for $V_{DD} - V_{EE}$ level differences above 13V, a $V_{DD} - V_{SS}$ of at least 4.5V is required). For example, if $V_{DD} = +5V$, $V_{SS} = 0$, and $V_{EE} = -13.5V$, analog signals from - 13.5V to + 4.5V can be controlled by digital inputs of 0 to 4.5V. In certain applications, the external load-resistor current may include both V_{DD} and signal-line components. To

avoid drawing V_{DD} current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0,8 volt (evaluated from R_{ON} values shown in ELECTRICAL CHARACTERISTICS CHART). No V_{DD} current will flow through R_L if the switch current flows into lead 3 on the HCC/HCF4051 ; leads 3 and 13 on the HCC/HCF4052 ; leads 4, 14, and 15 on the HCC/HCF4053.
