## 75MHz, LVCMOS, LVPECL DUAL OUTPUT OSCILLATOR

### GENERAL DESCRIPTION

The ICS843-75 is a SAS/SATA Dual Output Oscillator and a member of the HiPerClocks™ family of high performance devices from ICS. The ICS843-75 uses a 25MHz crystal to synthesize 75MHz. The ICS843-75 has excellent jitter performance. The ICS843-75 is packaged in a small 8-pin TSSOP, making it ideal for use in systems with limited board space.

### FEATURES

- One LVCMOS/LVTTL output, 15Ω output impedance  
One LVPECL output pair
- Crystal oscillator interface designed for 25MHz, 18pF parallel resonant crystal
- Output frequency: 75MHz
- Random jitter: 3.07ps (maximum)
- Deterministic jitter: 0.13ps (maximum)
- 3.3V operating supply
- 0°C to 70°C ambient operating temperature
- Available in both standard and lead-free RoHS-compliant packages

### RECOMMENDATIONS FOR UNUSED OUTPUT PINS

#### LVCMOS OUTPUT:

An unused LVCMOS output should be terminated with  $100\Omega$  to ground as close as possible to the device.

#### LVPECL OUTPUT

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

### CRYSTAL INPUT INTERFACE

The ICS843-75 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in Figure 1 below were determined using a 25MHz, 18pF parallel

resonant crystal and were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Figure 1. CRYSTAL INPUT INTERFACE

### FREQUENCY STABILITY

The table shown below provides a basic guideline in selecting the proper quartz crystal that meets a timing budget of  $\pm 100\text{ppm}$ . For more information on selecting the proper

crystal, see the application note, *Crystal Timing Budget and Accuracy for FemtoClock™*.

Parameter	Typical	Units
Frequency Tolerance	$\pm 30$	ppm
Frequency Stability	$\pm 30$	ppm
Aging for 10 Years	$\pm 15$	ppm

### TERMINATION FOR 3.3V LVPECL OUTPUT

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

drive  $50\Omega$  transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 2A and 2B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS843-75. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS843-75 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 0.3V = 3.6V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.6V * 110mA = 396mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**

$$\text{Total Power}_{\_MAX} (3.465V, \text{ with all outputs switching}) = 396mW + 30mW = 426mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 90.5°C/W per Table 6A below.

Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:  
 $70°C + 0.426W * 90.5°C/W = 108.6°C$ . This is below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

$\theta_{JA}$ by Velocity (Meters per Second)			
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	101.7°C/W	90.5°C/W	89.8°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load. LVPECL output driver circuit and termination are shown in Figure 3.

FIGURE 3. LVPECL DRIVER CIRCUIT AND TERMINATION

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.9V$

$$(V_{CC\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.7V$

$$(V_{CC\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd\_H$  is power dissipation when the output drives high.  
 $Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V)) / R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX})) / R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.9V) / 50\Omega] * 0.9V = 19.8mW$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V)) / R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX})) / R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.7V) / 50\Omega] * 1.7V = 10.2mW$$

Total Power Dissipation per output pair =  $Pd\_H + Pd\_L = 30mW$
