## 512Kx36 & 1Mx18 QDR™ b2 SRAM

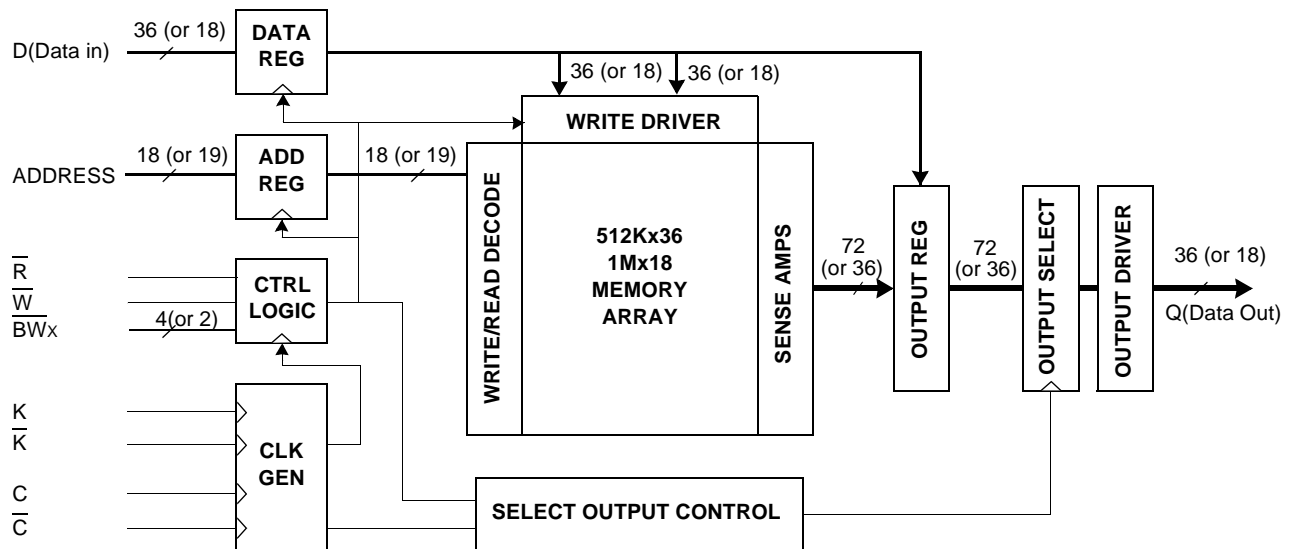

### 512Kx36-bit, 1Mx18-bit QDR™ SRAM

#### FEATURES

- 2.5V+0.1V/-0.1V Power Supply.
- I/O Supply Voltage 1.5V+0.1V/-0.1V for 1.5V I/O, 1.8V+0.1V/-0.1V for 1.8V I/O.
- Separate independent read and write data ports with concurrent read and write operation
- HSTL I/O.
- Full data coherency, providing most current data .
- Synchronous pipeline read with self timed early write.
- Registered address, control and data input/output.
- DDR(Double Data Rate) Interface on read and write ports.
- Fixed 2-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks(K and  $\bar{K}$ ) for accurate DDR timing at clock rising edges only.
- Two Input clocks for output data(C and  $\bar{C}$ ) to minimize clock-skew and flight-time mismatches.
- Single address bus.
- Byte writable function.
- Separate read/write control pin( $\bar{R}$  and  $\bar{W}$ )
- Simple depth expansion with no data contention.
- Programmable output impedance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array FBGA) with body size of 13x15mm

Organization	Part Number	Cycle Time	Access Time	Unit
X36	K7Q163652A-FC16	6.0	2.5	ns
	K7Q163652A-FC13	7.5	3.0	ns
	K7Q163652A-FC10	10.0	3.0	ns

## GENERAL DESCRIPTION

The K7Q163652A and K7Q161852A are 18,874,368-bits QDR(Quad Data Rate) Synchronous Pipelined Burst SRAMs. They are organized as 524,288 words by 36bits for K7Q163652A and 1,048,576 words by 18 bits for K7Q161852A.

The QDR operation is possible by supporting DDR read and write operations through separate data output and input ports with the same cycle. Memory bandwidth is maximized as data can be transferred into sram on every rising edge of  $\overline{K}$  and  $\overline{K}$ , and transferred out of sram on every rising edge of  $\overline{C}$  and  $\overline{C}$ . And totally independent read and write ports eliminate the need for high speed bus turn around.

Address, data inputs, and all control signals are synchronized to the input clock (  $\overline{K}$  or  $\overline{K}$  ). Normally data outputs are synchronized to output clocks (  $\overline{C}$  and  $\overline{C}$  ), but when  $\overline{C}$  and  $\overline{C}$  are tied high, the data outputs are synchronized to the input clocks (  $\overline{K}$  and  $\overline{K}$  ). Read address is registered on rising edges of the input  $\overline{K}$  clocks, and write address is registered on rising edges of the input  $\overline{K}$  clocks. Common address bus is used to access address both for read and write operations.

The internal burst counter is fixed to 2-bit sequential for both read and write operations. Synchronous pipeline read and early write enable high speed operations. Simple depth expansion is accomplished by using  $\overline{R}$  and  $\overline{W}$  for port selection. Byte write operation is supported with  $\overline{BW}_0$  and  $\overline{BW}_1$  (  $\overline{BW}_2$  and  $\overline{BW}_3$  ) pins. IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.

The K7Q163652A and K7Q161852A are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

## Read Operations

Read cycles are initiated by activating  $\overline{R}$  at the rising edge of the positive input clock  $\overline{K}$ . Address is presented and stored in the read address register synchronized with  $\overline{K}$  clock.

For 2-bit burst DDR operation, it will access two 36-bit or 18-bit data words with each read command. The first pipelined data is transferred out of the device triggered by  $\overline{C}$  clock following next  $\overline{K}$  clock rising edge. Next burst data is triggered by the rising edge of following  $\overline{C}$  clock rising edge.

Continuous read operations are initiated with  $\overline{K}$  clock rising edge. And pipelined data are transferred out of device on every rising edge of both  $\overline{C}$  and  $\overline{C}$  clocks. In case  $\overline{C}$  and  $\overline{C}$  tied to high, output data are triggered by  $\overline{K}$  and  $\overline{K}$  instead of  $\overline{C}$  and  $\overline{C}$ .

When the  $\overline{R}$  is disabled after a read operation, the K7Q163652A and K7Q161852A will first complete burst read operation before entering into deselect mode at the next  $\overline{K}$  clock rising edge. Then output drivers disabled automatically to high impedance state.

---

## Write Operations

Write cycles are initiated by activating  $\overline{W}$  at the rising edge of the positive input clock K.  $\overline{W}$  Address is presented and stored in the write address register synchronized with following  $\overline{K}$  clock.

For 2-bit burst DDR operation, it will write two 36-bit or 18-bit data words with each write command. The first "early" data is transferred and registered in to the device synchronous with same K clock rising edge with  $\overline{W}$  presented. Next burst data is transferred and registered synchronous with following  $\overline{K}$  clock rising edge.

Continuous write operations are initiated with K rising edge. And "early written" data is presented to the device on every rising edge of both K and  $\overline{K}$  clocks.

When the  $\overline{W}$  is disabled, the K7Q163652A and K7Q161852A will enter into deselect mode. The device disregards input data presented on the same cycle  $\overline{W}$  disabled.

The K7Q163652A and K7Q161852A support byte write operations. With activating  $\overline{BW}_0$  or  $\overline{BW}_1$  ( $\overline{BW}_2$  or  $\overline{BW}_3$ ) in write cycle, only one byte of input data is presented. In K7Q161852A,  $\overline{BW}_0$  controls write operation to D0:D8,  $\overline{BW}_1$  controls write operation to D9:D17. And in K7Q163652A  $\overline{BW}_2$  controls write operation to D18:D26,  $\overline{BW}_3$  controls write operation to D27:D35.

## Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to Vss through a precision resistor(RQ). The value of RQ (within 15%) is five times the output impedance desired.

For example, 250Ω resistor will give an output impedance of 50Ω. Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles. In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM.

There are no power up requirements for the SRAM. However, to guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

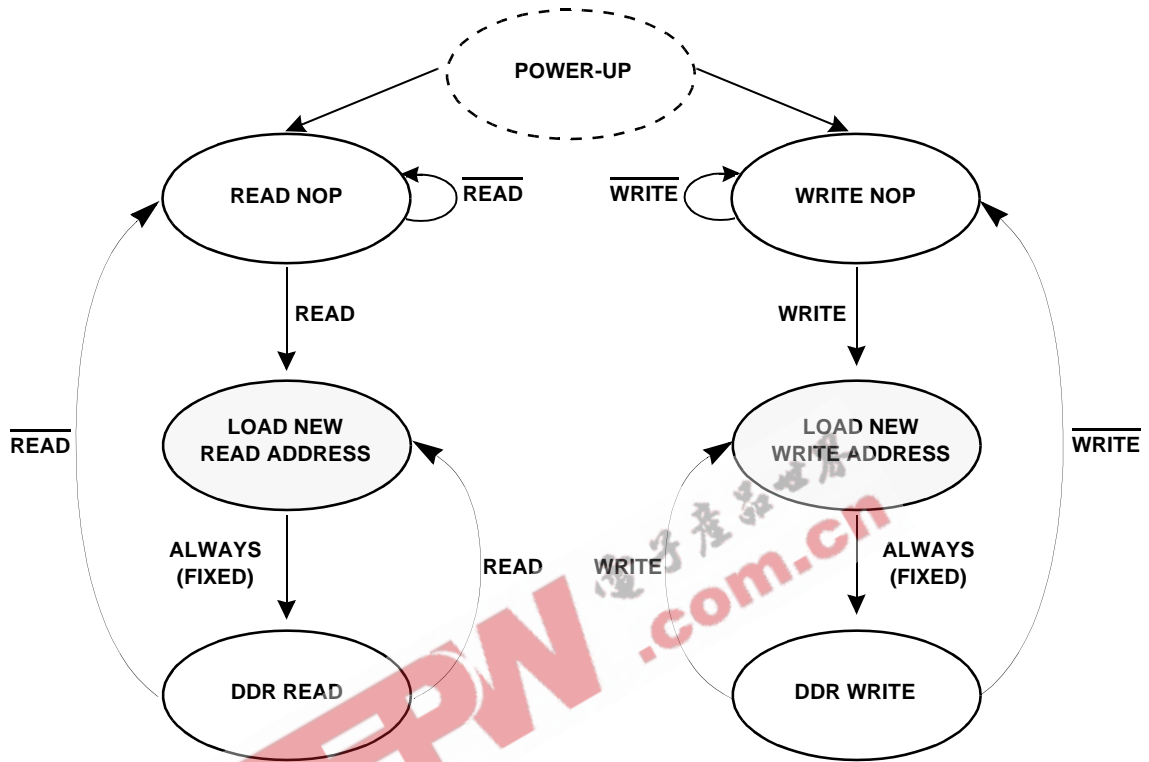

## Single Clock Mode

The K7Q163652A and K7Q161852A can be used with the single clock pair K and  $\overline{K}$ . In this mode, C and  $\overline{C}$  must be tied high during power up and this single clock pair control both the input and output registers. C and  $\overline{C}$  cannot be tied high during operation. System flight time and clock skew could not be compensated in single clock mode.

## Depth Expansion

Separate input and output ports enables easy depth expansion. Each port can be selected and deselected independently and read and write operation do not affect each other. Before chip deselected, all read and write pending operations are completed.

STATE DIAGRAM

- Notes:**
1. Internal burst counter is fixed as 2-bit linear, i.e. when first address is A0+0, next internal burst address is A0+1.
  2. "READ" refers to read active status with  $\overline{R}$ =Low, " $\overline{READ}$ " refers to read inactive status with  $\overline{R}$ =high. "WRITE" and " $\overline{WRITE}$ " are the same case.
  3. Read and write state machine can be active simultaneously.
  4. State machine control timing sequence is controlled by K.

**TRUTH TABLES**

**SYNCHRONOUS TRUTH TABLE**

K	$\bar{R}$	$\bar{W}$	D		Q		OPERATION
			D(A0)	D(A1)	Q(A0)	Q(A1)

**ABSOLUTE MAXIMUM RATINGS\***

PARAMETER	SYMBOL	RATING	UNIT
Voltage on VDD Supply Relative to VSS	VDD	-0.5 to 3.6	V
Voltage on VDDQ Supply Relative to VSS	VDDQ	-0.5 to VDD	V
Voltage on Input Pin Relative to VSS	VIN	-0.5 to VDD+0.3	V
Power Dissipation	PD	1.8	W
Storage Temperature	TSTG	-65 to 150	°C
Operating Temperature	TOPR	0 to 70	°C
Storage Temperature Range Under Bias	TBIAS	-10 to 85	°C

\*Note: 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.  
 2. VDDQ must not exceed VDD during normal operation.

**DC ELECTRICAL CHARACTERISTICS(VDD=2.5V ±0.1V, TA=0°C to +70°C)**

Standby Current(NOP) : DDR	ISB1	Device deselected, IOUT=0mA, f=Max, All Inputs≤0.2V or ≥ VDD-0.2V	-16	-	220	mA	1,6
			-13	-	200		
			-10	-	190		
Output High Voltage	VOH1		VDDQ/2	VDDQ	V	2,7	
Output Low Voltage	VOL1		VSS	VDDQ/2	V	3,7	
Output High Voltage	VOH2	IOH=-1.0mA	VDDQ-0.2	VDDQ	V	4	
Output Low Voltage	VOL2	IOL=1.0mA	VSS	0.2	V	4	
Input Low Voltage	VIL		-0.3	VREF-0.1	V	8,9	
Input High Voltage	VIH		VREF+0.1	VDDQ+0.3	V	8,10	

Notes: 1. Minimum cycle. IOUT=0mA.  
 2.  $|I_{OH}| = (V_{DDQ}/2)/(RQ/5) \pm 15\%$  @  $V_{OH} = V_{DDQ}/2$  for  $175\Omega \leq RQ \leq 350\Omega$ .  
 3.  $|I_{OL}| = (V_{DDQ}/2)/(RQ/5) \pm 15\%$  @  $V_{OL} = V_{DDQ}/2$  for  $175\Omega \leq RQ \leq 350\Omega$ .  
 4. Minimum Impedance Mode when ZQ pin is connected to VSS.  
 5. Operating current is calculated with 50% read cycles and 50% write cycles.  
 6. Standby Current is only after all pending read and write burst operations are completed.  
 7. Programmable Impedance Mode.  
 8. These are DC test criteria. DC design criteria is  $V_{REF} \pm 50mV$ . The AC  $V_{IH}/V_{IL}$  levels are defined separately for measuring timing parameters.  
 9.  $V_{IL} (Min)_{DC} = -0.3V$ ,  $V_{IL} (Min)_{AC} = -1.5V$  (pulse width ≤ 3ns).  
 10.  $V_{IH} (Max)_{DC} = V_{DDQ} + 0.3$ ,  $V_{IH} (Max)_{AC} = V_{DDQ} + 0.85V$  (pulse width ≤ 3ns).

**Overshoot Timing**

**Undershoot Timing**

**Note:** For power-up,  $V_{IH} \leq V_{DDQ} + 0.3V$  and  $V_{DD} \leq 2.4V$  and  $V_{DDQ} \leq 1.4V$  for  $t \leq 200ms$

**OPERATING CONDITIONS** ( $0^\circ C \leq T_A \leq 70^\circ C$ )

Control inputs valid to K rising edge	tIVKH	0.7		0.8		1.0		ns	2
Data-in valid to K, $\bar{K}$ rising edge	tDVKH	0.7		0.8		1.0		ns	
<b>Hold Times</b>									
K rising edge to address hold	tkHAX	0.7		0.8		1.0		v	
K rising edge to control inputs hold	tkHIX	0.7		0.8		1.0		ns	
K, $\bar{K}$ rising edge to data-in hold	tkHDX	0.7		0.8		1.0		ns	

**Notes:** 1. All address inputs must meet the specified setup and hold times for all latching clock edges.

2. Control signals are R,  $\bar{W}$ , BW<sub>0</sub>, BW<sub>1</sub> and (BW<sub>2</sub>, BW<sub>3</sub>, also for x36)

3. If C,  $\bar{C}$  are tied high, K,  $\bar{K}$  become the references for C,  $\bar{C}$  timing parameters.

4. To avoid bus contention, at a given voltage and temperature tCHQX<sub>1</sub> is bigger than tCHQZ.

The specs as shown do not imply bus contention because tCHQX<sub>1</sub> is a MIN parameter that is worst case at totally different test conditions (0°C, 2.6V) than tCHQZ, which is a MAX parameter (worst case at 70°C, 2.4V)

It is not possible for two SRAMs on the same board to be at such different voltage and temperature.

## 512Kx36 & 1Mx18 QDR™ b2 SRAM

### AC TEST CONDITIONS

Parameter	Symbol	Value	Unit
Core Power Supply Voltage	V <sub>DD</sub>	2.4~2.6	V
Output Power Supply Voltage	V <sub>DDQ</sub>	1.4~1.9	V
Input High/Low Level	V <sub>IH</sub> /V <sub>IL</sub>	1.25/0.25	V
Input Reference Level	V <sub>REF</sub>	0.75	V
Input Rise/Fall Time	T <sub>R</sub> /T <sub>F</sub>	0.3/0.3	ns
Output Timing Reference Level		V <sub>DDQ</sub> /2	V

Note: Parameters are tested with R<sub>Q</sub>=250Ω

### AC TEST OUTPUT LOAD

### PIN CAPACITANCE

PRMETER	SYMBOL	TESTCONDITION	MIN	MAX	Unit	NOTES
Address Control Input Capacitance	C <sub>IN</sub>	V <sub>IN</sub> =0V	4	5	pF	
Input and Output Capacitance	C <sub>OUT</sub>	V <sub>OUT</sub> =0V	6	7	pF	
Clock Capacitance	C <sub>CLK</sub>	-	5	6	pF	

Note: 1. Parameters are tested with R<sub>Q</sub>=250Ω and V<sub>DDQ</sub>=1.5V.  
2. Periodically sampled and not 100% tested.

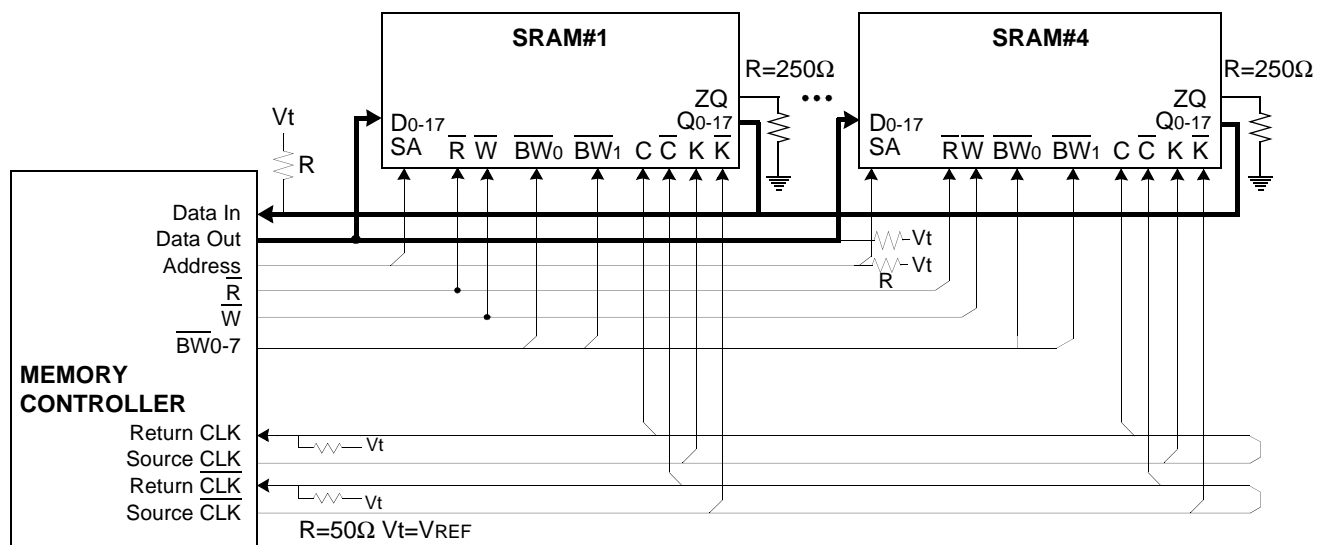

### THERMAL RESISTANCE

PRMETER	SYMBOL	TYP	Unit	NOTES
Junction to Ambient	θ <sub>JA</sub>	24.0	°C/W	
Junction to Case	θ <sub>JC</sub>	2.8	°C/W	
Junction to Pins	θ <sub>JB</sub>	5.5	°C/W	

Note: Junction temperature is a function of on-chip power dissipation, package thermal impedance, mounting site temperature and mounting site thermal impedance. T<sub>J</sub>=T<sub>A</sub> + P<sub>D</sub> × θ<sub>JA</sub>

### APPLICATION INFORMATION

#### 1Mx18

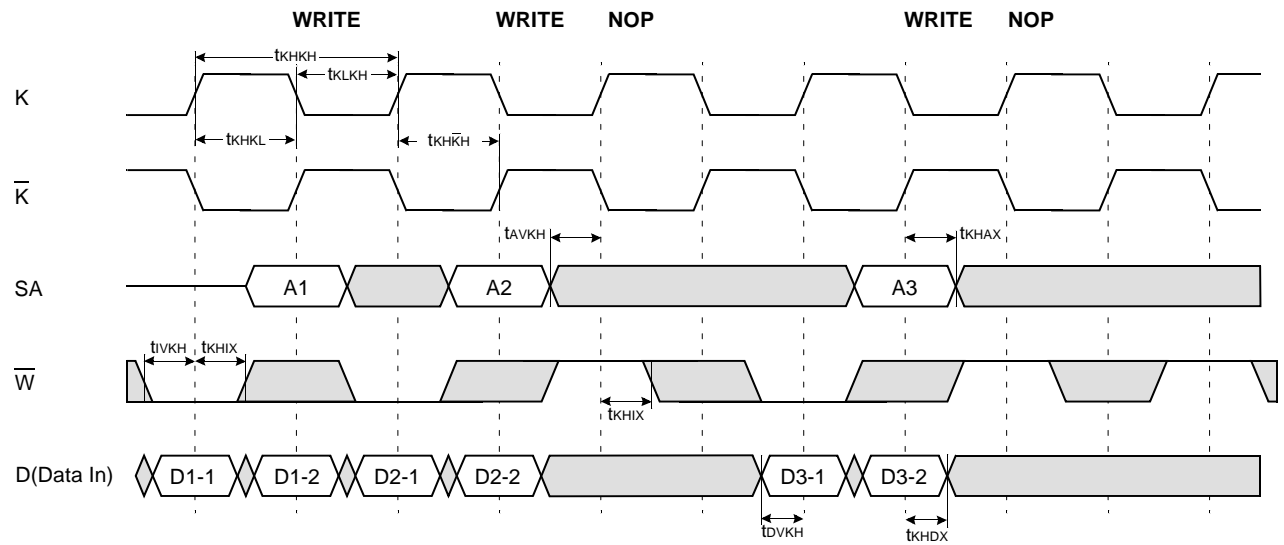

TIMING WAVE FORMS OF READ AND NOP

Note: 1. Q1-1 refers to output from address A1+0, Q1-2 refers to output from address A1+1 i.e. the next internal burst address following A1+0.  
2. Outputs are disabled(High-Z) one cycle after a NOP.

TIMING WAVE FORMS OF WRITE AND NOP

TIMING WAVE FORMS OF READ, WRITE AND NOP

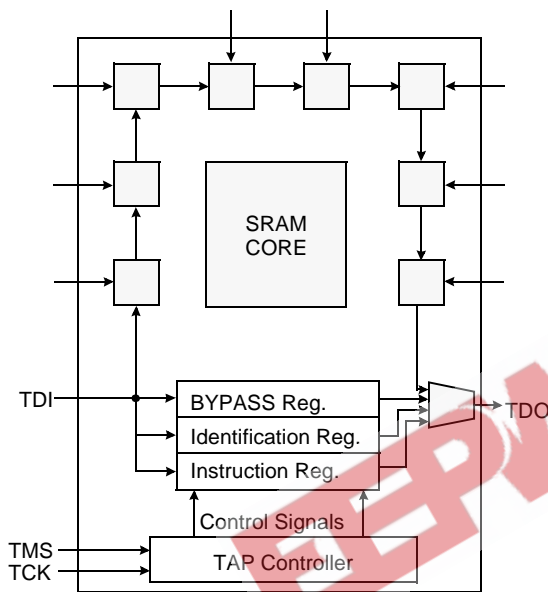

- Note:**
1. Q1-1 refers to output from address A1+0, Q1-2 refers to output from address A1+1 i.e. the next internal burst address following A1+0.
  2. Outputs are disabled(High-Z) one cycle after a NOP.
  3. If address A1=A2, data Q1-1=D2-1, data Q1-2=D2-2. Write data is forwarded immediately as read results.
  4.  $\bar{W}x$  are assumed active.

**IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG**

This part contains an IEEE standard 1149.1 Compatible Test Access Port(TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to Vss to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to V<sub>DD</sub> through a resistor. TDO should be left unconnected.

**JTAG Block Diagram**

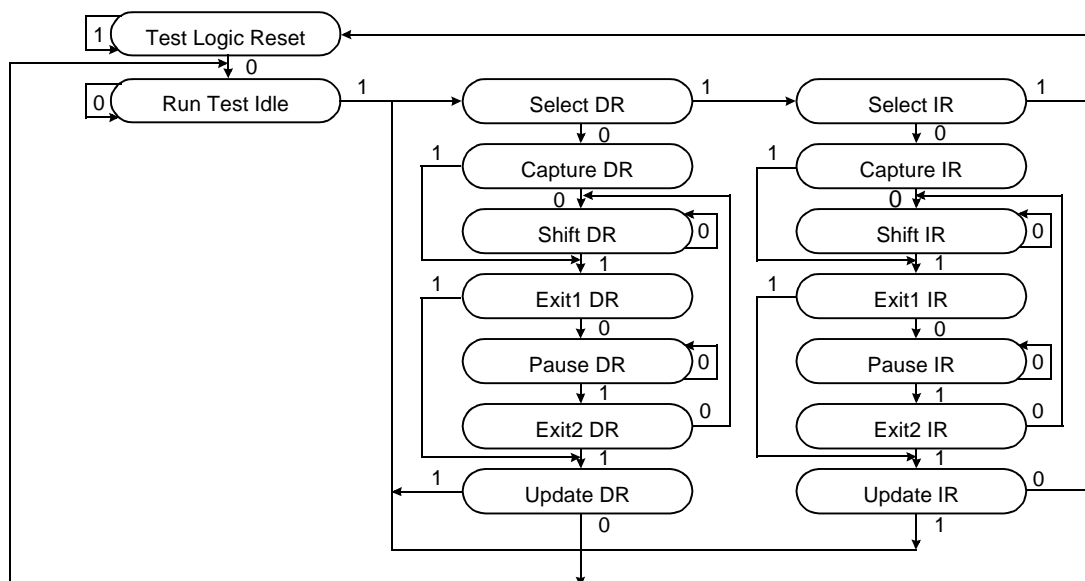

**JTAG Instruction Coding**

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	BYPASS	Bypass Register	4
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	BYPASS	Bypass Register	4
1	1	1	BYPASS	Bypass Register	4

**NOTE :**

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to V<sub>SS</sub> when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.
