

#### THREE TERMINAL NEGATIVE VOLTAGE REGULATORS -5V, -8V, -12V, -15V.

KIA79M × × Series of three-terminal regulators is available with fixed output voltages of -5V, -8V, -12V, and -15V.

These devices need only one external component—a compensation capacitor at the output. The KIA79MXX series is packaged in the TO-220 power package, and is capable of supplying 0.5A of output current. These regulators employ internal current limiting, safe area protection, and thermal shutdown for protection against virtually all overload conditions.

Low ground pin current of the KIA79MXX series allows output voltage to be easily boosted above the preset value with a resistor divider. The low quiescent current of these devices with a specified maximum change with line and load ensures good regulation in the voltage boosted mode.

#### FEATURES

- Thermal, Short Circuit and Safe Area Protection
- High Ripple Rejection.
- 0.5A Output Current
- 4% Tolerance on Preset Output Voltage.

#### MAXIMUM RATINGS (Ta=25 °C)

CHARACTERISTIC		SYMBOL	RATING	UNIT
Input Voltage		$V_{IN}$	-35	V
Power Dissipation	$T_C=25\text{ °C}$	$P_D$	20.8	W
	Without Heatsink		2.0	
Operating Junction Temperature		$T_j$	-40 ~ 150	°C
Storage Temperature		$T_{stg}$	-55 ~ 150	°C
Soldering Temperature (10 seconds)		$T_{sol}$	260	°C3

## Design Considerations

The KIA79MXX fixed voltage regulator series have thermal overload protection from excessive power, internal short circuit protection which limits the circuit's maximum current, and output transistor safe-area compensation for reducing the output current as the voltage across the pass transistor is increased.

Although the internal power dissipation is limited, the junction temperature must be kept below the maximum specified temperature in order to meet data sheet specifications. To calculate the maximum junction temperature or heat sink required, the following thermal resistance values should be used ;

PACKAGE	$\theta_{JC}$ (°C/W)	$\theta_{JA}$ (°C/W)
TO-220	6.0	62.5

$$P_{D\text{MAX}} = \frac{T_{j\text{max}} - T_a}{\theta_{JC} + \theta_{CA}} \quad \text{or}$$

$$= \frac{T_{j\text{max}} - T_a}{\theta_{JA}} \quad (\text{Without a Heat Sink})$$

$$\theta_{CA} = \theta_{CS} + \theta_{SA}$$

Solving for  $T_j$  :

$$T_j = T_A + P_D (\theta_{JC} + \theta_{CA})$$

$$= T_A + P_D \theta_{JA} \quad (\text{Without a Heat Sink})$$

Where

$T_j$  = Junction Temperature

$T_A$  = Ambient Temperature

$P_D$  = Power Dissipation

$\theta_{JC}$  = Junction to Case Thermal Resistance

$\theta_{CA}$  = Case to Ambient Thermal Resistance

$\theta_{CS}$  = Case to Heat Sink Thermal Resistance

$\theta_{SA}$  = Heat Sink to Ambient Thermal Resistance

$\theta_{JA}$  = Junction to Ambient Thermal Resistance

## Typical Applications

Bypass capacitors are necessary for stable operation of the KIA79MXX series of regulators over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

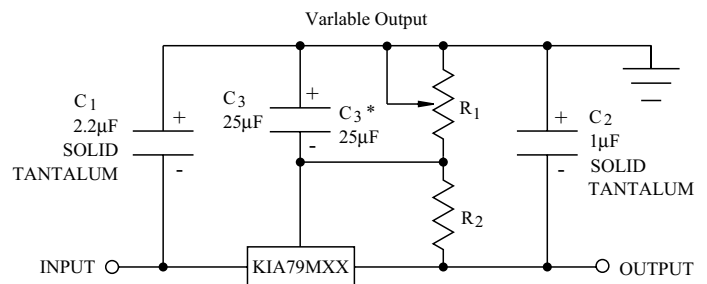

The bypass capacitors (2.2 $\mu$ F on the input, 1.0 $\mu$ F on the output), Should be ceramic or solid tantalum which have good high frequency characteristics. If aluminum electrolytics are used, their values should be 10 $\mu$ F or larger. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

(1) Required if regulator is separated from filter capacitor by more than 3". For value given, capacitor must be solid tantalum. 25 $\mu$ F aluminum electrolytic may be substituted.

(2) Required for stability. For value given, capacitor must be solid tantalum. 25 $\mu$ F aluminum electrolytic may be substituted. Values given may be increased without limit.

For output capacitance in excess of 100 $\mu$ F, a high current diode from input to output (1N4001, etc.) will protect the regulator from momentary input shorts.

\* Improves transient response and ripple rejection.

Do not increase beyond  $50 \leq F$ .

$$V_{\text{OUT}} = V_{\text{SET}} \left( \frac{R_1 + R_2}{R_2} \right)$$
