CMOS IC

LC75348, 75348M

Single-Chip Electronic Volume and Tone Control System

Overview

The LC75348 and LC75348M are electronic volume and tone control ICs that provide volume, balance, 2-band equalizer, input gain control, and input switching functions while requiring a minimal number of external components.

Functions

- Volume: 81 levels: 0 dB to –79 dB (in 1 dB steps) and –∞.
  The left and right channels are controlled independently, allowing a balance function to be implemented.
- Bass: Peaking characteristics bass control with ±20 dB range in 2 dB steps.
- Treble: Shelving characteristics treble control with ±10 dB range in 2 dB steps.
- Selector: One of 4 inputs can be selected for both left and right channels.
- Input gain: Input signal amplification from 0 to +30 dB (in 2 dB steps)

Features

- Built-in buffer amplifiers reduce the number of external components required.
- Fabricated in a silicon gate CMOS process for minimal switching noise from built-in switches and minimal switching noise even when there is no input signal.
- Built-in zero cross circuits minimize switching noise when input signals are present.
- Built-in $V_{DD}/2$ reference voltage generator circuit.
- All functions are controlled from serial data. Supports the CCB bus.

Package Dimensions

unit: mm

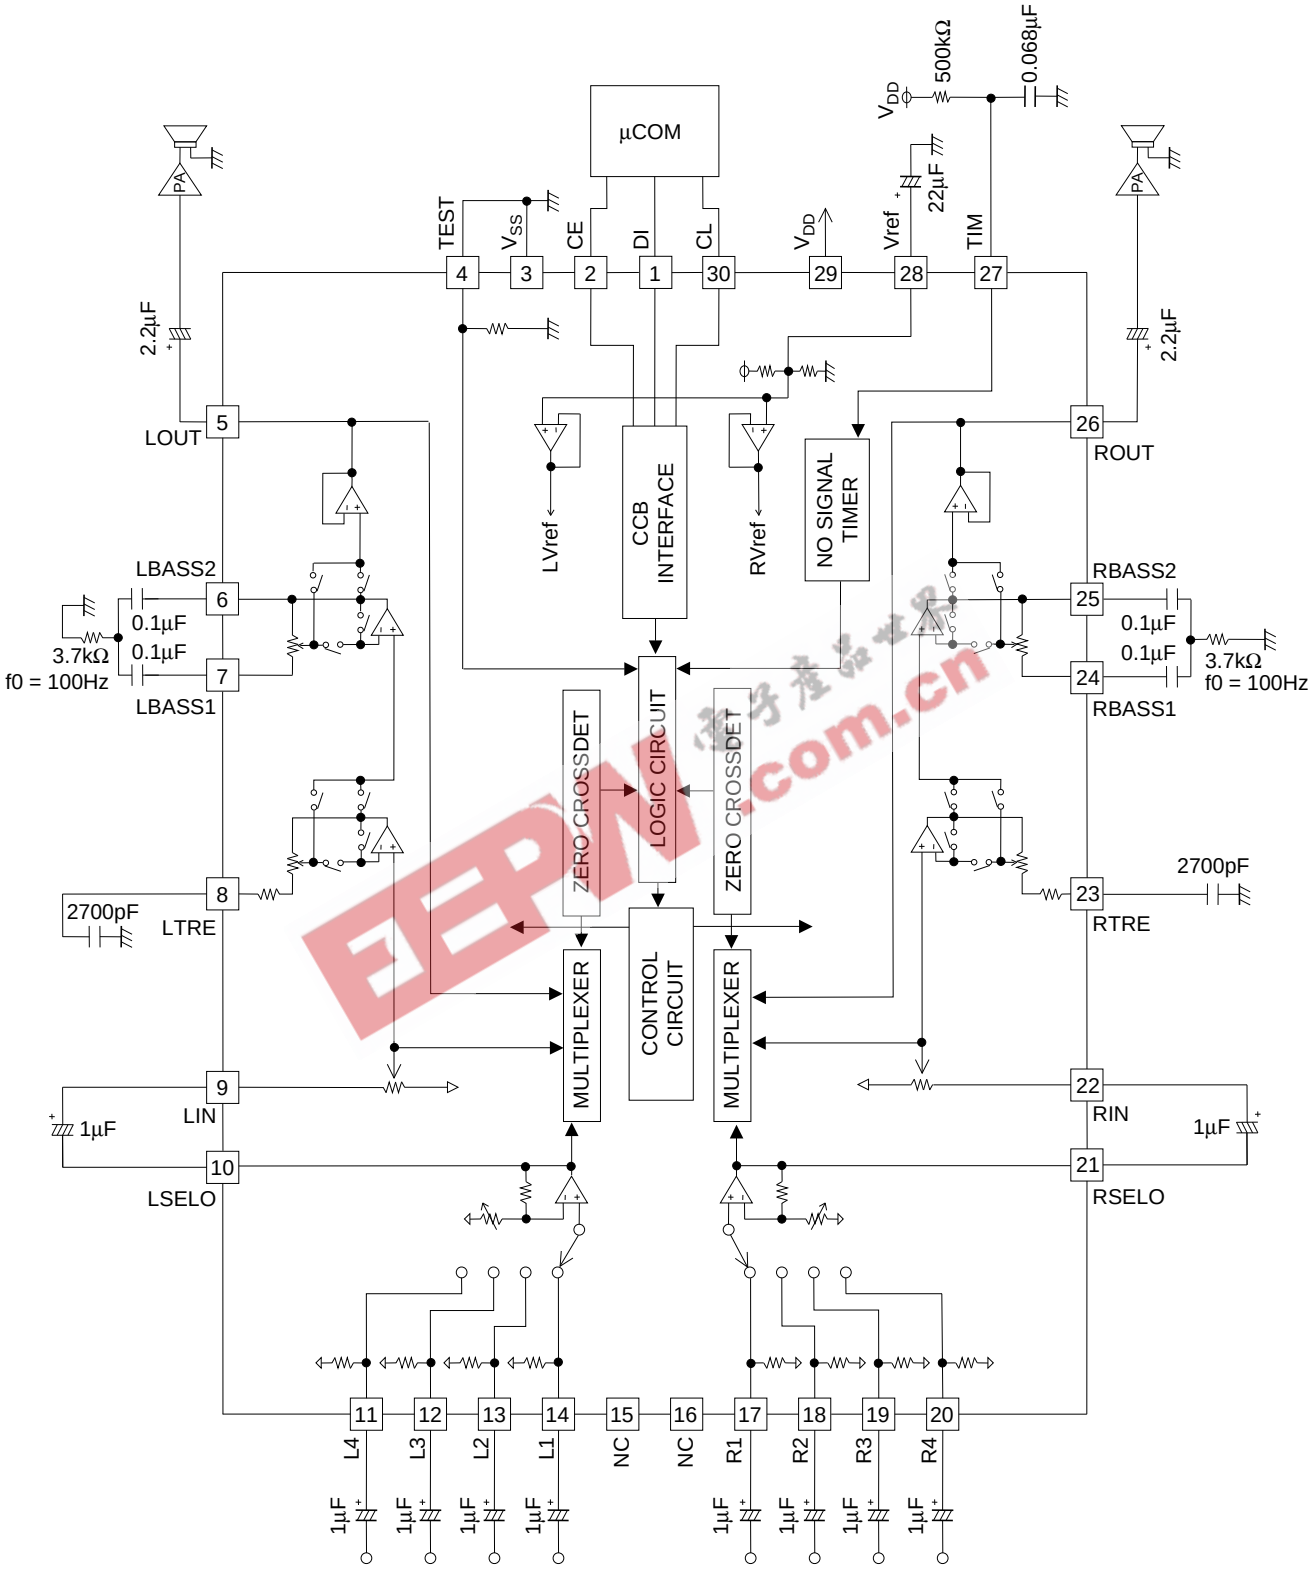
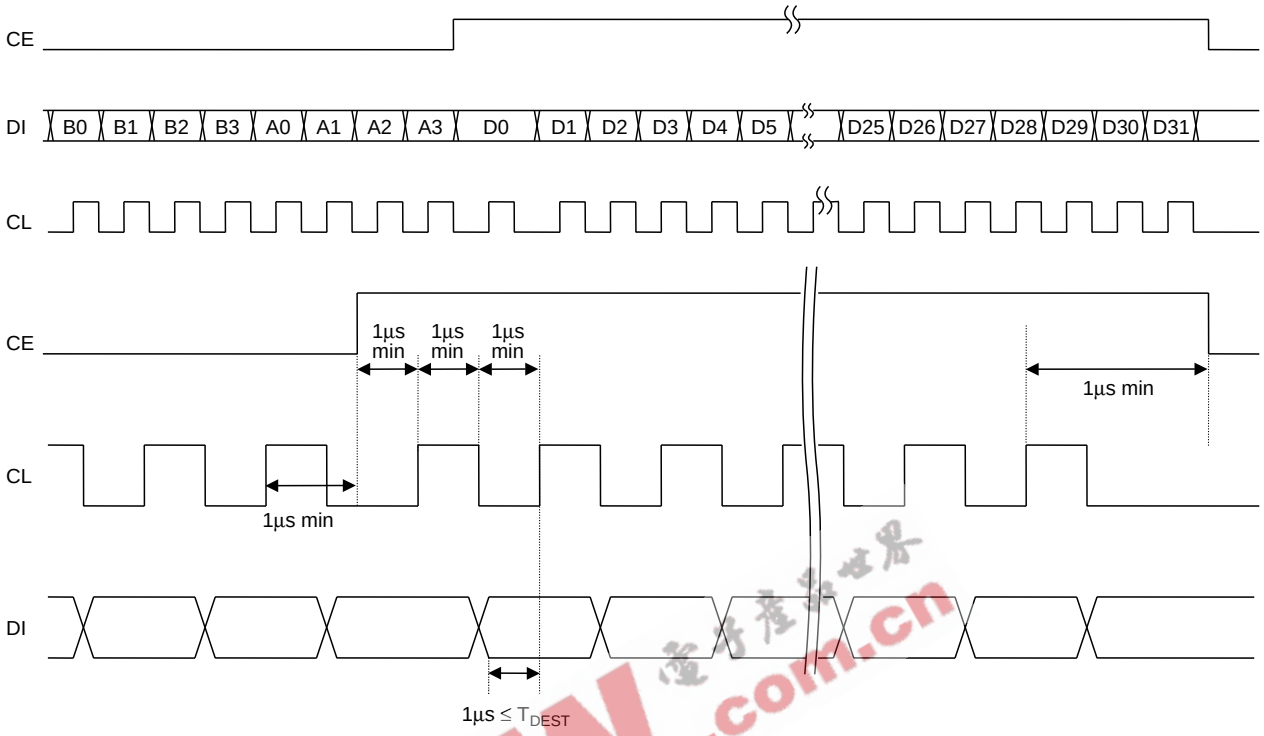
Equivalent Circuit



Control System Timing and Data Format

The stipulated serial data must be input to the CL, DI, and CE pins to control the LC75348 and LC75348M. The data structure has a total of 40 bits, of which 8 bits are address and 32 bits are data.



- Address code (B0 to A3)

  The data has an 8-bit address code, which allows this IC to be used with the SANYO CCB serial bus.

Address code (LSB)

B0	B1	B2	B3	A0	A1	A2	A3
0	1	0	0	0	0	0	1

Continued on next page.

EEPW .com.cn

Continued from preceding page.

Pin No.	Pin	Function	Notes
28	Vref	• 1/2 V_{DD} voltage generator used for the analog system ground A capacitor of about 10 µF must be connected between Vref and AV_{SS} (V_{SS}) to minimize power supply ripple.	3	V_{SS}	• Ground	
29	V_{DD}	• Power supply	
27	TIM	• Time setting for the zero cross circuit no signal state time. If no zero cross is recognized between the time the data is stored and the time this timer completes, the data is acquired forcibly.	2	CE	• Chip enable Data is written to the internal latch and the analog switches operate when this pin goes from high to low. Data transfers are enabled when this pin is high.	1 30	DI CL	• Inputs for the clock and serial data signals used to control this IC	
4	TEST	• Electronic volume control test pin. This pin must be tied to the V_{SS} level.	15 16	NC	• Unused (no connection) pins. These pins must be either left open or tied to V_{SS}.	

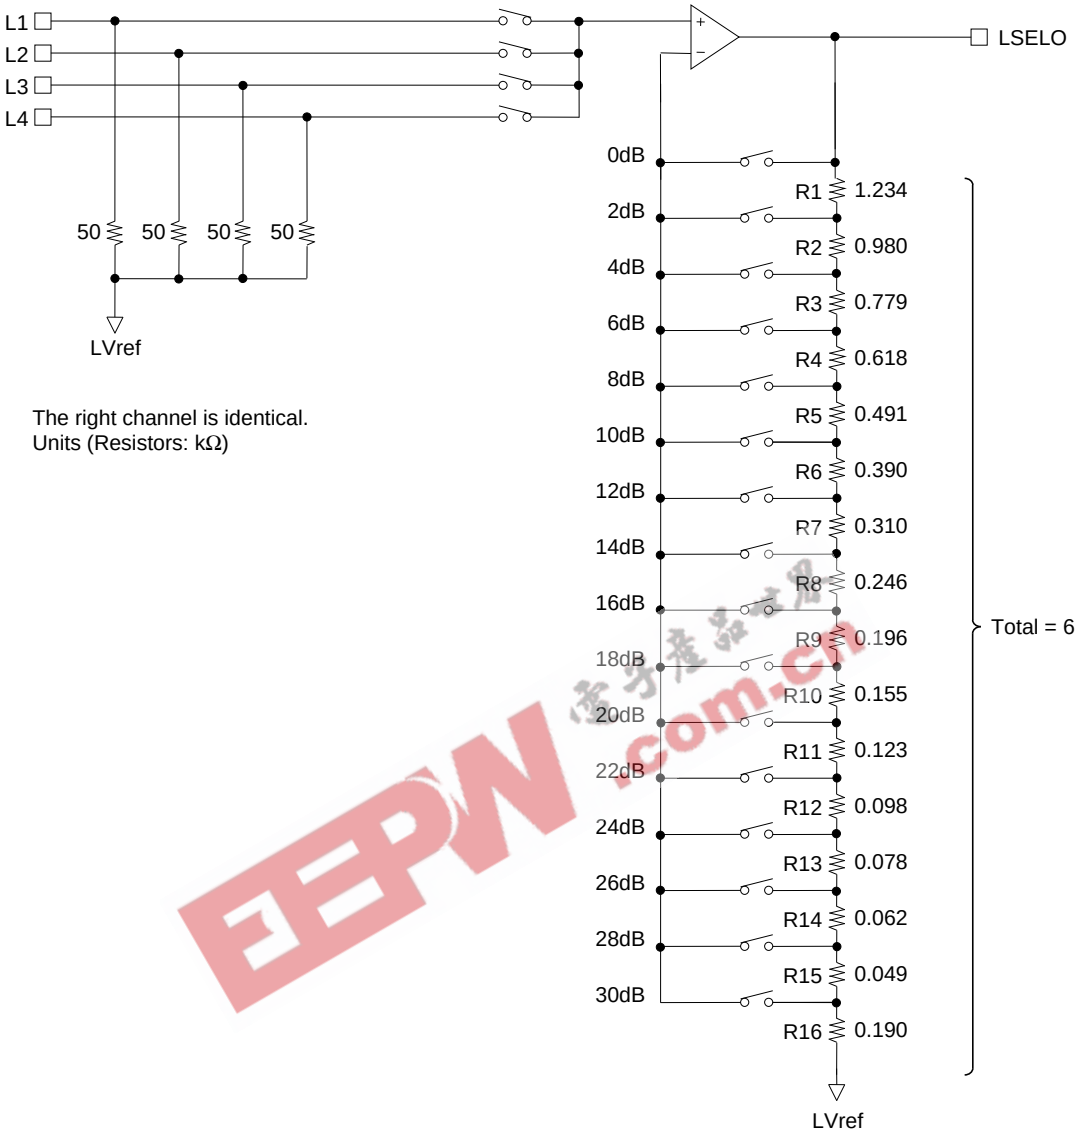
EEPW .com.cn

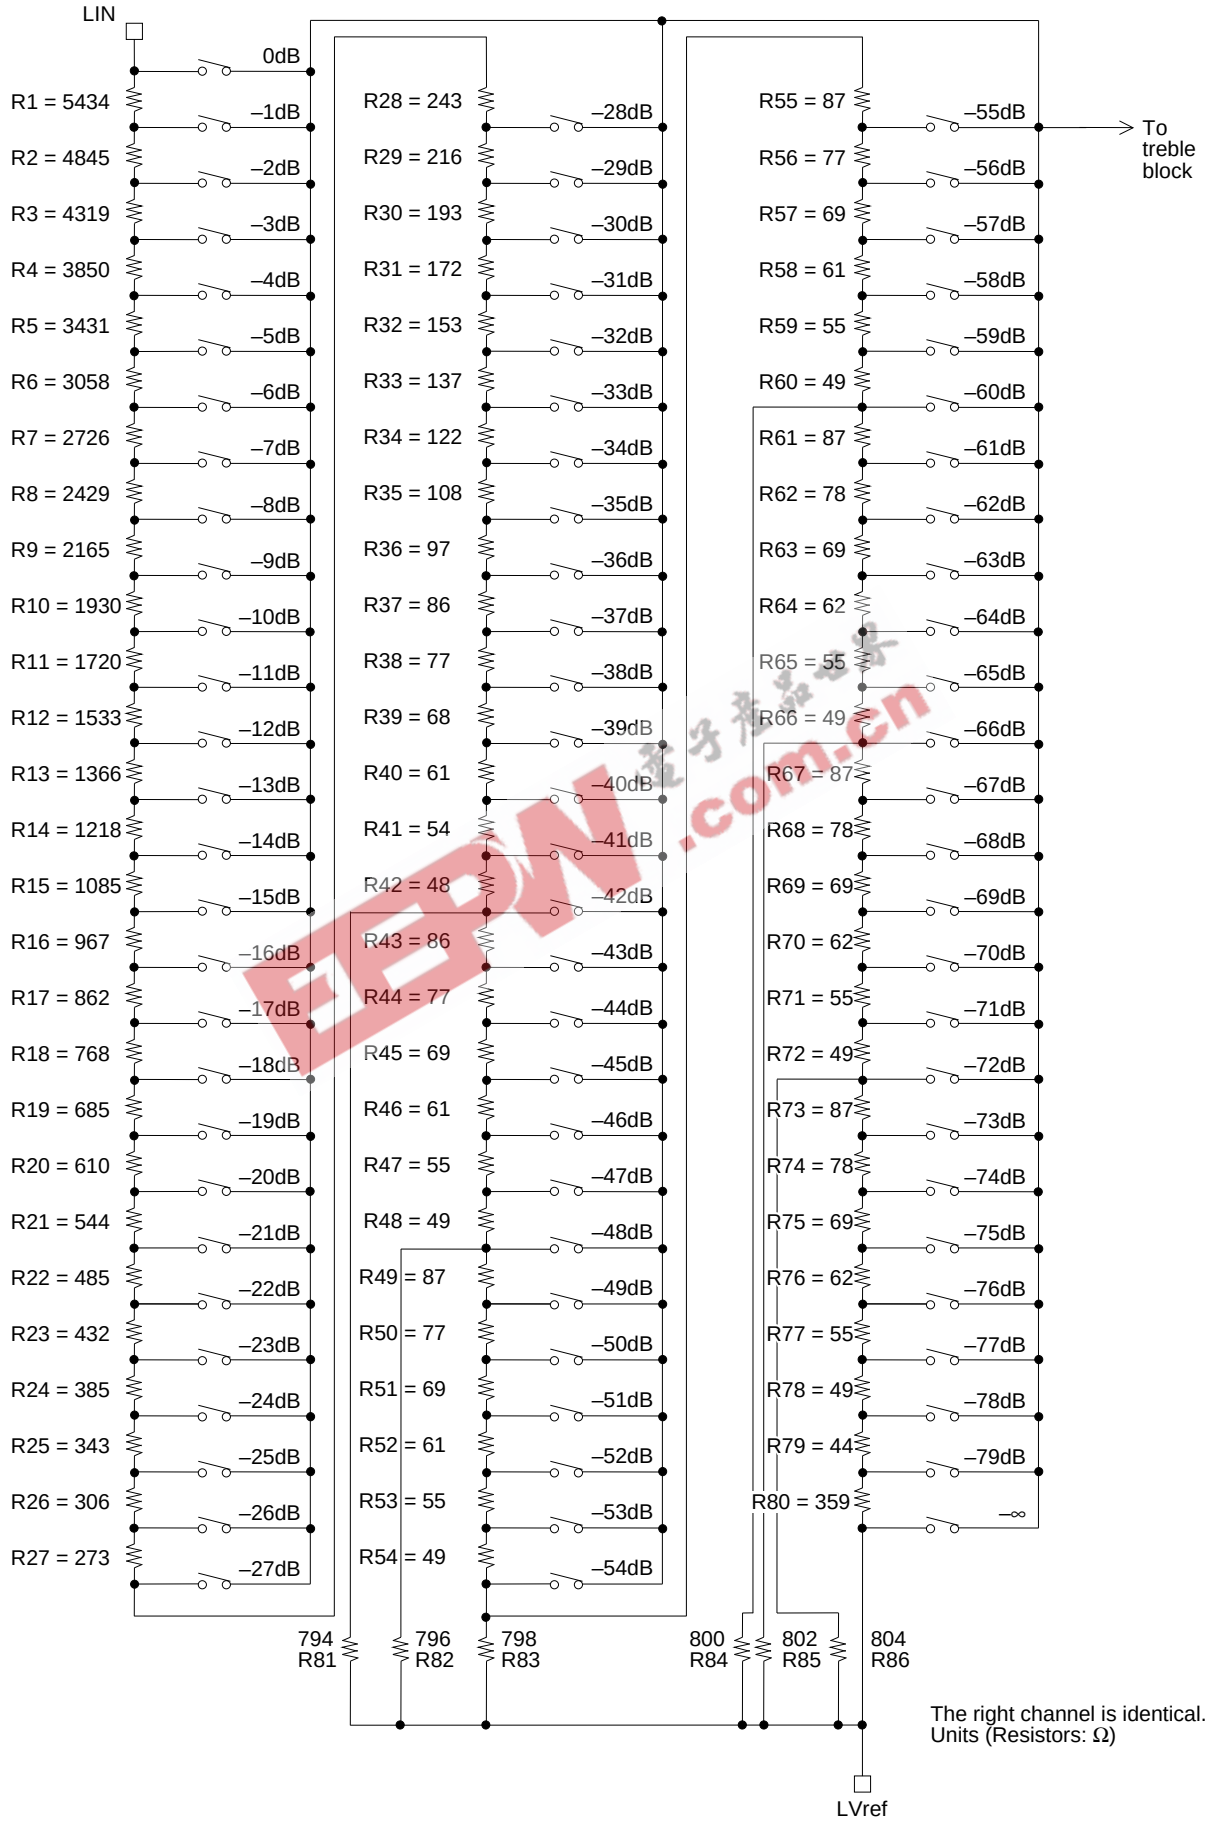
Internal Equivalent Circuits

- Selector Block Equivalent Circuit

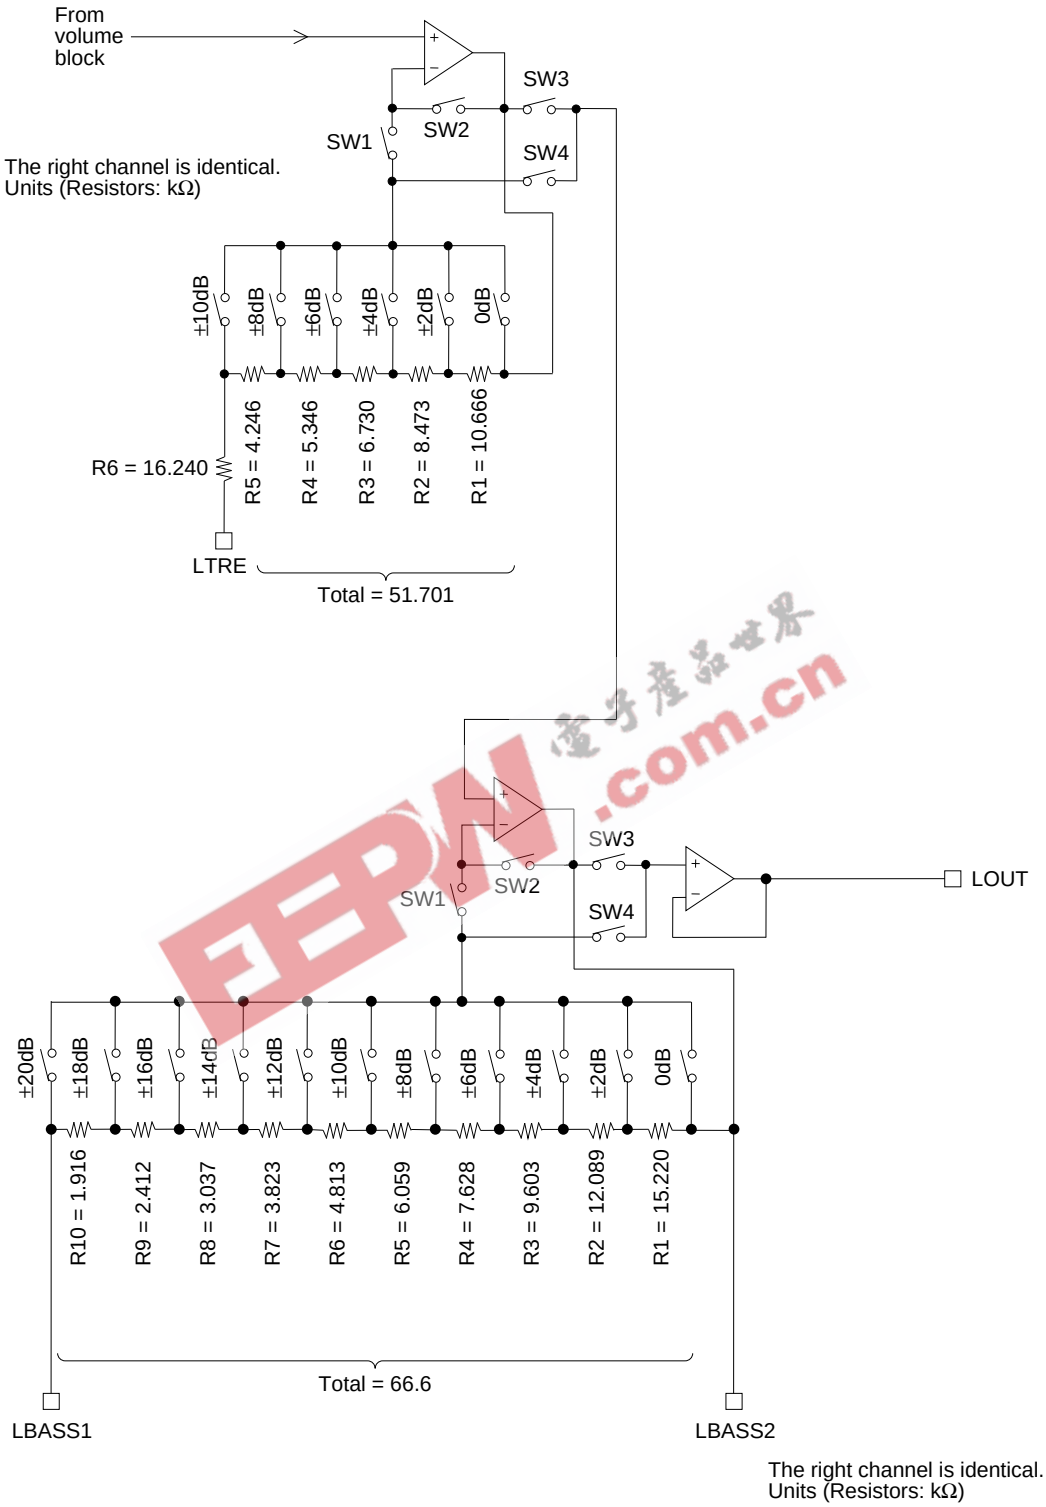


The right channel is identical.
Units (Resistors: kΩ)

• Volume Control Block Internal Equivalent Circuit



• Treble/Bass Band Block Internal Equivalent Circuit

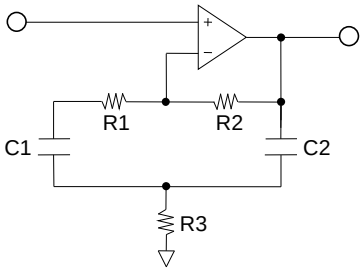


For boost, switches SW1 and SW3 are on, and for cut, switches SW2 and SW4 are on.
For 0 dB, the 0dBSW, SW2, and SW3 are on.

Bass Band Circuit

This section presents the equivalent circuit and the formulas for calculating the R and C values for a 100 Hz center frequency.

- Bass band equivalent circuit



- Sample calculation
  Specifications: Center frequency: f0 = 100 Hz
  Gain at maximum boost: G = 20 dB
  Assume R1 = 0, R2 = 66.6 kΩ, and C1 = C2 = C.

(1) Determine R3 from the G = 20 dB condition.

$$G_{+20dB} = 20 \times LOG_{10}\left(1 + \frac{R2}{2R3}\right)$$

$$R3 = \frac{R2}{2\left(10^{G+20dB/20} - 1\right)} = \frac{66000}{2 \times (10 - 1)} \cong 3.7\text{k}\Omega$$

(2) Determine C from the center frequency f0 = 100 Hz condition

$$f0 = \frac{1}{2\pi\sqrt{R3R2C1C2}}$$

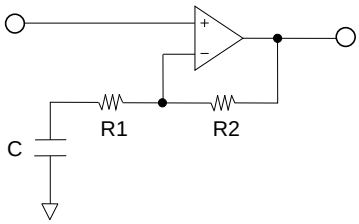
$$C = \frac{1}{2\pi f0\sqrt{R3R2}} = \frac{1}{2\pi \times 100\sqrt{66000 \times 3700}} \cong 0.1\mu F$$

(3) Determine Q

$$Q = \frac{R3R2}{2R3} \cdot \frac{1}{\sqrt{R3R2}} \cong 2.1$$

Treble Band Circuit

The treble band circuit can provide shelving characteristics.
This section presents the equivalent circuit for boost operation and the calculation formulas.



- Sample calculation
  Specifications: Set frequency: f = 26,000 Hz
  Gain at maximum boost: $G_{+10\ dB}$ = 10 dB
  Assume R1 = 16.240 KΩ, and R2 = 35.461 KΩ.

  The constants mentioned above are calculated as follows.

$$G = 20 \times LOG_{10}\left(1 + \frac{R2}{\sqrt{R1^2 + (1/\omega C)^2}}\right)$$

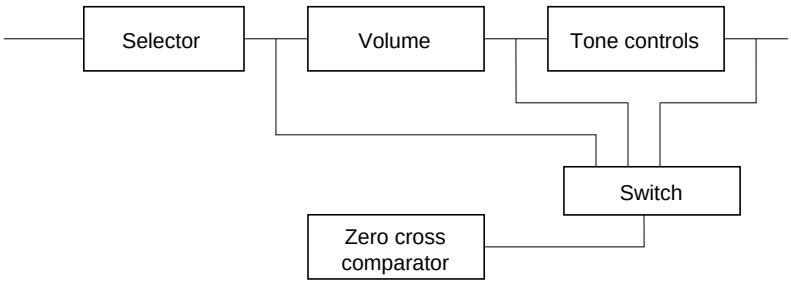
$$C = \frac{1}{2\pi f\sqrt{\left(\frac{R2}{10^{G/20}-1}\right)^2 - R1^2}}$$

$$= \frac{1}{2\pi 26000\sqrt{\left(\frac{35461}{3.16-1}\right)^2 - 16240^2}} \cong 2700(pF)$$

EEPW .com.cn

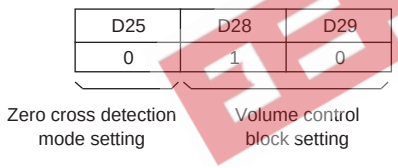
Usage Notes

- The internal transistor states are undefined when power is first applied. Applications must mute the output until control data has been written to the IC.
- Operational description of the zero cross switching circuit
  The LC75348 and LC75348M provide a function that can switch the zero cross comparator signal detection point, allowing applications to select an optimal detection point for the block whose data is being updated. Basically, switching noise can be minimized if the signal immediately following the block whose data is updated is input to the zero cross comparator. This means that the detection point must be switched each time data is updated.



LC75348 and LC75348M Zero Cross Detection Circuit

- Zero cross switching control procedure
  The zero cross switching control procedure consists of three steps. First, set the zero cross control bit to zero cross detection mode (D25 = 0), then specify the block for detection (with bits D28 and D29), and finally transfer the data. Since these control bits are latched first, immediately after the data is transferred, i.e. on the CE falling edge, the mode can be set in a single data transfer operation when updating the volume control or other control block data. The figure below presents an example of the control used when updating the volume control block data.



- Zero cross timer setting

  If the input signal is lower than the zero cross comparator detection sensitivity, or if a low-frequency signal is input, the state in which the circuit cannot detect a zero cross may continue and the input data will not be latched during that period.

  The zero cross timer sets a time for the data to be latched forcibly in states such as this where a zero cross cannot be detected.

  For example, to set a 25 ms time:

  T = 0.69 CR

  Assume C = 0.068 µF. The R will be:

  $$R = \frac{25 \times 10^{-3}}{0.69 \times 0.068 \times 10^{-6}} \approx 530\ k\Omega$$

  Normally, a time in the range 10 to 50 ms is used.

- Notes on serial data transfer

  (1) Cover the CL, DI, and CE signal lines with the ground pattern or use shielded lines to prevent the high-frequency digital signals carried by these lines from entering the analog signal system.

  (2) The LC75348 and LC75348M data format consists of 8 bits of address and 32 bits of data. When transmitting data as an even multiple of 8 bits (when transferring 36 bits of data), use the data format shown below.

LC75348 and LC75348M Data Reception in Multiples of 8 Bits
