## On-Screen Display Controller IC

### Overview

The LC74798 and LC74798M are on-screen display controller CMOS ICs that display characters and patterns on the TV screen under microprocessor control. These ICs include a built-in PDC/VPS/UDT interface circuit.

### Features

- Display format: 24 characters by 12 rows (Up to 288 characters)
- Character format: 12 (horizontal) × 18 (vertical) dots
- Character sizes: Three sizes each in the horizontal and vertical directions
- Characters in font: 128
- Initial display positions: 64 horizontal positions and 64 vertical positions
- Blinking: Specifiable in character units
- Blinking types: Two periods supported: 1.0 second and 0.5 second
- Blanking: Over the whole font (12 × 18 dots)
- Background color
  - 8 colors (internal synchronization mode): 4fSC
  - 6 colors (internal synchronization mode): 2fSC
  - Blue background only: NTSC
- Line background color
  - Three lines can be set up.
  - 8 line background colors (in internal synchronization mode): 4fSC
  - 6 line background colors (in internal synchronization mode): 2fSC
- External control input: 8-bit serial input format
- On-chip sync separator and AFC circuits
- On-chip PDC/VPS/UDT interface circuit
- Video outputs: PAL and NTSC format composite video outputs
- Package: DIP30SD (400 mil)  
MFP30S (375 mil)

### Pin Descriptions

Pin No.	Pin name	Function	Notes
1	V <sub>SS1</sub>	Ground	Ground connection (digital system ground)
2	Xtal <sub>IN</sub>	Crystal oscillator (MUTE input)	These pins are used either to connect the crystal and capacitors used to form an external crystal oscillator circuit to generate the internal synchronizing signals, or to input an external clock signal (2fsc or 4fsc). As a mask option, the Xtal <sub>OUT</sub> pin can be set to function as the MUTE input pin. When this pin is set low, the video output is held at the pedestal level. (A pull-up resistor is built in and the input has hysteresis characteristics.)
3	Xtal <sub>OUT</sub> (MUTE)		
4	CTRL1 (CHABLK)	Crystal oscillator input switching (CHABLK output)	Switches the mode between external clock input and crystal oscillator operation. A low level selects crystal oscillator operation and a high level selects external clock input. As a mask option, the CTRL1 input pin can be set to function as the CHABLK (character - frame) output. This is a 3-value output.
5	$\overline{\text{CS2}}$	Enable input 2	Enable input for the PDC/VPS data output. Data output is enabled when this input is low. A pull-up resistor is built in and the input has hysteresis characteristics.
6	SCLK2	Clock input 2	Clock input for the PDC/VPS data output. A pull-up resistor is built in and the input has hysteresis characteristics.
7	DOUT	Data output	PDC/VPS data output. (This can be either an n-channel open-drain output or a CMOS output.)
8	SYNC <sub>JDG</sub>	External synchronizing signal judgment output	Outputs the state of the external synchronizing signal presence/absence judgment. Outputs a high level when synchronizing signals are present. Outputs the crystal oscillator clock when CS1 and RST are low. (This signal is not output on command resets.)
9	$\overline{\text{CS1}}$	Enable input 1	Enable input for the OSD serial data input. Serial data input is enabled when this pin is low. A pull-up resistor is built in and the input has hysteresis characteristics.
10	SCLK1	Clock input 1	Serial data input enable pin. A pull-up resistor is built in and the input has hysteresis characteristics.
11	SIN1	Data input 1	Serial data input. A pull-up resistor is built in and the input has hysteresis characteristics.
12	V <sub>DD2</sub>	Power supply	Composite video signal level adjustment power supply (analog system power supply)
13	CP <sub>OUT</sub>	Charge pump output	Charge pump output. Connect a low-pass filter to this pin.
14	VCO <sub>IN</sub>	Oscillator control voltage input	VCO oscillator control voltage input. (For data slicing)
15	V <sub>SS3</sub>	Ground	Ground (VCO ground)
16	VCO <sub>R</sub>	Oscillator range adjustment	VCO oscillator range adjustment resistor connection
17	VCO <sub>IN2</sub>	Oscillator control voltage input 2	VCO oscillator control voltage input. For character display.
18	V <sub>DD3</sub>	Power supply (+5 V)	Power supply (+5 V: VCO power supply)
19	CV <sub>OUT</sub>	Video signal output	Composite video signal output
20	V <sub>SS2</sub>	Ground	Ground (analog system ground)
21	CV <sub>IN</sub>	Video signal input	Composite video signal input
22	CV <sub>CR</sub>	Video signal input	SECAM chrominance signal input
23	V <sub>DD1</sub>	Power supply (+5 V)	Power supply (+5 V: digital system power supply)
24	SYN <sub>IN</sub>	Sync separator circuit input	Video signal input to the internal sync separator circuit
25	SEPC	Sync separator circuit adjustment	Internal sync separator circuit adjustment
26	SEP <sub>OUT</sub>	Composite synchronizing signal output	Internal sync separator circuit composite synchronizing signal output. Can be switched to function as a signal (high, low, or ST. pulse) output by the MOD0 setting when SEL0 is high.
27	SEP <sub>IN</sub>	Vertical synchronizing signal input	Inputs the vertical synchronizing signal created by integrating the SEP <sub>OUT</sub> pin output signal. An integration circuit must be connected between this pin and the SEP <sub>OUT</sub> pin. This pin must be tied to V <sub>DD1</sub> if unused. This pin is valid when CTL3 is set high.
28	CDLR	Background color phase adjustment	Background color phase adjustment resistor connection
29	$\overline{\text{RST}}$	Reset input	System reset input. A pull-up resistor is built in and the input has hysteresis characteristics.
30	V <sub>DD1</sub>	Power supply (+5 V)	Power supply (+5 V: digital system power supply)

Note \*: A capacitor of at least 2000 pF must be connected between the V<sub>DD1</sub> power supply and V<sub>SS1</sub>.

### Display Control Commands

Display control commands have an 8-bit format and are transferred using the serial input function. Commands consist of a command identification code in the first byte and command data in the following bytes. The following commands are supported.

- 1 COMMAND0: Display memory (VRAM) write address setup command
- 2 COMMAND1: Display character data write command
- 3 COMMAND2: Vertical display start position and vertical character size setup command
- 4 COMMAND3: Horizontal display start position and horizontal character size setup command
- 5 COMMAND4: Display control setup command
- 6 COMMAND5: Display control setup command
- 7 COMMAND6: Synchronizing signal detection setup command
- 8 COMMAND7 to COMMAND12: Display control setup commands
- 9 COMMAND13 to COMMAND17: VPS/PDC control commands

Once written, a first byte command identification code is stored until the next first byte is written. However, when the display character data write command (COMMAND1) is written, the LC74798/M locks into the display character data write mode, and another first byte cannot be written. When the CS pin is set high, the LC74798/M is set to the COMMAND0 (display memory write address setup mode) state.

**Display Screen Structure**

The display consists of 12 lines of 24 characters.

Up to 288 characters can be displayed.

The number of characters that can be displayed is reduced from the 288 maximum when enlarged characters are displayed.

Display memory addresses are specified as row (0 to B hexadecimal) and column (0 to 17 hexadecimal) addresses.
