LC74783, 74783M

On-Screen Display Controller LSI for VCR Products

Overview

The LC74783 and LC74783M are on-screen display CMOS LSIs that display characters and patterns on a TV screen under microprocessor control. The LC74783 and LC74783M display up to 12 lines of 24 characters, each in a 12×18 dot matrix.

Features

- Display structure: 12 lines \times 24 characters (up to 288 characters)
- Character structure: 12 (horizontal) \times 18 (vertical) dots
- Character sizes: Three size settings each in the vertical and horizontal directions
- Character set: 128 characters
- Display start position: 64 position settings each in the vertical and horizontal directions
- Blinking: In individual character units
- Blinking types: Two types with periods of about 0.5 and 1.0 second
- Blanking: Whole font area blanking (12×18 dots)
- Background colors: 8 colors (in internal synchronization mode): 4fSC (NTSC/PAL/PAL-M/PAL-N)

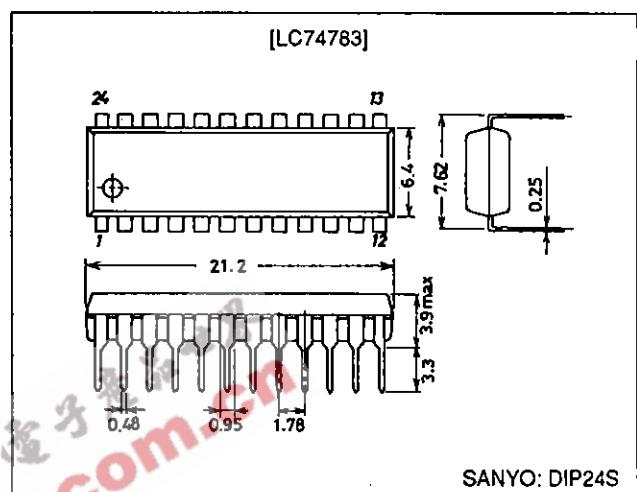

Background colors: 4 colors (in internal synchronization mode): 2fSC (NTSC)

Background colors: 1 color (blue) (in internal synchronization mode): 2fSC (PAL/PAL-M/PAL-N)

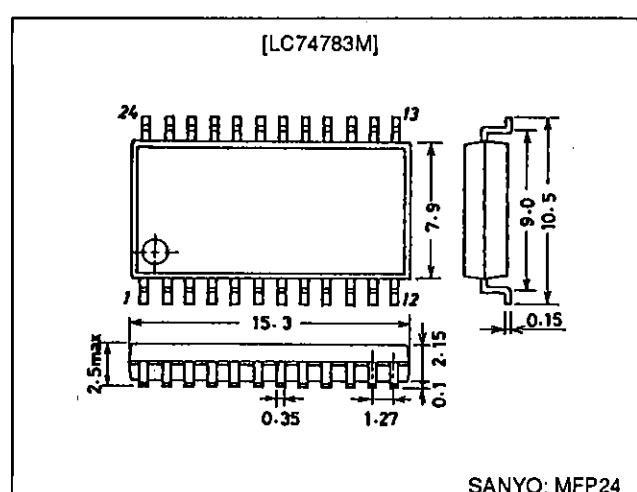

- External control input: 8-bit serial input format
- Built-in sync separator circuit
- Character blanked data output
- Video output: Compound NTSC, PAL, PAL-N and PAL-M output

Pin Functions

Pin No.	Symbol	Function	Description
1	V _{SS1}	Ground	Ground connection (digital system ground)
2	Xtal _{IN}	Crystal oscillator connection	Used to connect the crystal oscillator and capacitor used to generate the internal synchronization signal, or to input an external clock (2fsc or 4fsc).
3	Xtal _{OUT}		
4	CTRL1	Crystal oscillator input switching	Switches between external clock input mode and crystal oscillator mode. Low = crystal oscillator mode, high = external clock mode
5	BLANK	Blanking output	Outputs the blank signal (the OR of the character and border signals). (Outputs a composite sync signal when MOD0 is high.) Outputs the crystal oscillator clock during reset (when the RST pin is low), but can be set up to not output this signal by microprocessor command.
6	OSC _{IN}	LC oscillator connection	Connections for the coil and capacitor that form the oscillator that generates the character output dot clock.
7	OSC _{OUT}		
8	CHARA	Character output	Outputs the character signal. (Functions as the external synchronization signal discrimination signal output pin when MOD0 is high, and outputs the state of the judgment as to whether the external synchronization signal is present or not. Outputs a high level when the synchronization signal is present.) Outputs the dot clock (LC oscillator) during reset, but can be set up to not output this signal by microprocessor command.
9	CS	Enable input	Serial data input enable input. Serial data input is enabled when low. A pull-up resistor is built in (hysteresis input).
10	SCLK	Clock input	Serial data input clock input. A pull-up resistor is built in (hysteresis input).
11	SIN	Data input	Serial data input. A pull-up resistor is built in (hysteresis input).
12	V _{DD2}	Power supply	Composite video signal level adjustment power supply pin (analog system power supply).
13	CV _{OUT}	Video signal output	Composite video signal output
14	NC		Must be either connected to ground or left open.
15	CV _{IN}	Video signal input	Composite video signal input
16	CV _{CR}	Video signal input	SECAM chrominance signal input
17	V _{DD1}	Power supply	Power supply (+5 V: digital system power supply)
18	SYN _{IN}	Sync separator circuit input	Video signal input for the built-in sync separator circuit (Used for either horizontal synchronization signal or composite sync signal input when the built-in sync separator circuit is not used.)
19	SEP _C	Sync separator circuit bias voltage	Built-in sync separator circuit bias voltage monitor pin
20	SEP _{OUT}	Composite sync signal output	Built-in sync separator circuit composite sync signal output. (When MOD1 is high, outputs a high level during internal synchronization and a low level during external synchronization.) (Outputs the SYN _{IN} input signal when the internal sync separator circuit is not used.)
21	SEP _{IN}	Vertical synchronization signal input	Inputs a vertical synchronization signal created by integrating the SEP _{OUT} pin output signal. An integrator must be attached at the SEP _{OUT} pin. This pin must be tied to V _{DD1} if unused.
22	CTRL3	SEP _{IN} input control	Controls whether or not the VSYNC signal is input to the SEP _{IN} input. Low = VSYNC input, high = VSYNC not input.
23	RST	Reset input	System reset input. A pull-up resistor is built in (hysteresis input).
24	V _{DD1}	Power supply (+5 V)	Power supply (+5 V: digital system power supply)

Display Control Commands

The display control commands have a serial input format with 8-bit units. A command consists of a command identifier code in the first byte and data in the second and subsequent bytes. There are eight commands as listed below.

- ① COMMAND0: Display memory (VRAM) write address setup command
- ② COMMAND1: Display character data write command
- ③ COMMAND2: Vertical display start position and vertical character size setup command
- ④ COMMAND3: Horizontal display start position and horizontal character size setup command
- ⑤ COMMAND4: Display control setup command
- ⑥ COMMAND5: Display control setup command
- ⑦ COMMAND6: Synchronization signal detection setup command
- ⑧ COMMAND7: Display control setup command

Once written, the command identifier code in the first byte is stored until the next first byte is written. However, when the display character data write command (COMMAND1) is written, the LC74783/M locks into the display character data write mode, and another first byte cannot be written.

When a high level is input to the CS pin, the LC74783/M is set to COMMAND0 (display memory write address setup mode).

① COMMAND0 (Display memory write address setup command)

First byte

2	MOD0	0	Pin 5: Blank signal Pin 8: Character signal				
		1	Pin 5: Composite synchronization signal Pin 8: External synchronization signal discrimination output signal				
1	DISLIN	0	12 lines				
		1	10 lines				
0	MUT	0	Normal output				
		1	CV_{IN} is cut and CV_{OUT} is fixed at the pedestal level.				

Second byte

DA0 to DA7	Register name	Register content				Note
		State	Function			
7	—	0	Second byte identification bit			
6	RN2	0	RN2	RN1	RN0	Number of times HSYNC detected
		1	0	0	0	0 times
5	RN1	0	0	0	1	4 times
		1	0	1	0	8 times
4	RN0	0	0	1	0	16 times
		1	1	0	0	
3	SN3	0	SN3 SN2 SN1 SN0 Number of times HSYNC detected			
		1	0	0	0	Not detected
2	SN2	0	0	0	1	32 times
		1	0	0	1	64 times
1	SN1	0	0	1	0	128 times
		1	0	1	0	256 times
0	SN0	0	1	0	0	
		1	1	0	0	

Note: The register states are all set to zero when the LC74783/M is reset with the RST pin.

⑧ COMMAND7 (Display control setup command)

First byte

DA0 to DA7	Register name	Register content				Note	
		State	Function				
7	—	1					
6	—	1					
5	—	1	Command 7 identification code Display control setup				
4	—	1					
3	EX1	0	MODE1 setting output				
		1	PORT DATA1 setting output				
2	PD1	0	The output is set low.				
		1	The output is set high.				
1	EX0	0	MODE0 setting output				
		1	PORT DATA0 setting output				
0	PD0	0	The output is set low.				
		1	The output is set high.				

Second byte

DA0 to DA7	Register name	Register content		Note
		State	Function	
7	—	0	Second byte identification bit	
6	CINSEL	0	Blank (the OR of the character and the border) signal area	Switches the CV _{CR} on signal
		1	Video signal display area	
5	CINCTL	0	CV _{CR} : Off	CV _{CR} on/off setting
		1	CV _{CR} : On	
4	VNPSEL	0	V falling edge detection	Switches V acquisition polarity when internal V separation is used in external mode.
		1	V rising edge detection	
3	VSPSEL	0	VSEP: about 8.9 µs (for NTSC)	Switches the internal V separation time.
		1	VSEP: about 17.8 µs (for NTSC)	
2	MSKERS	0	Mask valid	HSYNC and VSYNC mask release
		1	Mask invalid	
1	MSKSEL	0	3H (for NTSC)	Switches the VSYNC mask.
		1	20H (for NTSC)	
0	EGL	0	Border level 0 only (VBK0)	Switches the border level (Only valid for BLK0 = 0 and BLK1 = 1)
		1	Border level has two stages (VBK0, VBK1)	

Note: The register states are all set to zero when the LC74783/M is reset with the RST pin.

Display Screen Structure

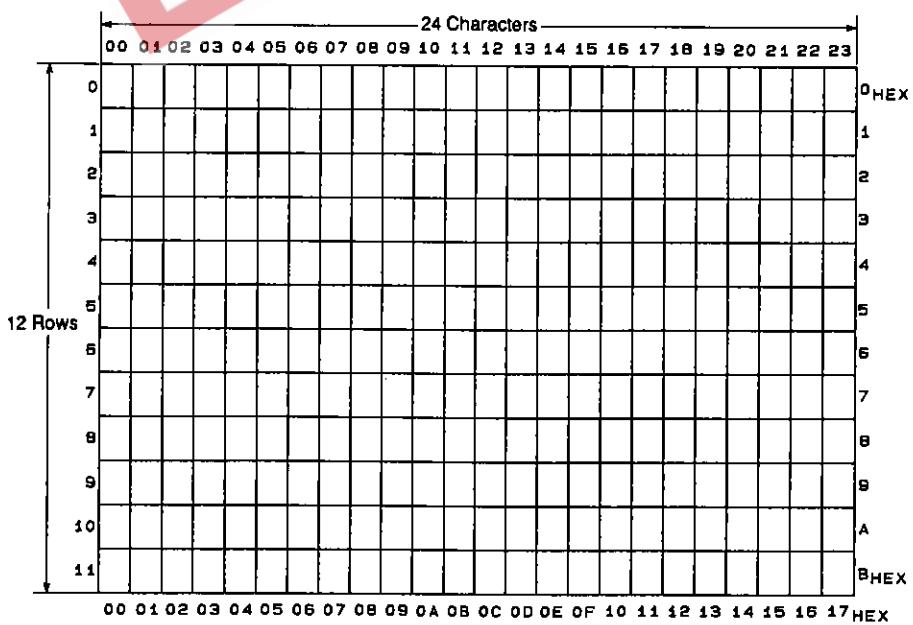

The display consists of 24 characters × 12 rows.

The maximum number of displayed character is 288.

The maximum number of characters is reduced to less than 288 when the character size is enlarged.

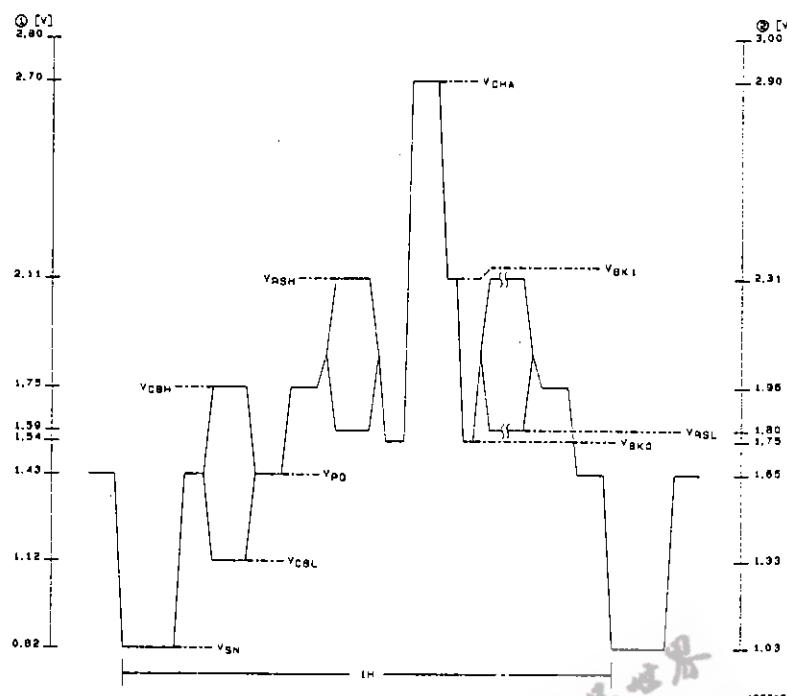

Display memory addresses are specified as row (0 to 11 decimal) and column (0 to 23 decimal) addresses.
