Quad Analog Switch/ Multiplexer/Demultiplexer with Separate Analog and Digital Power Supplies

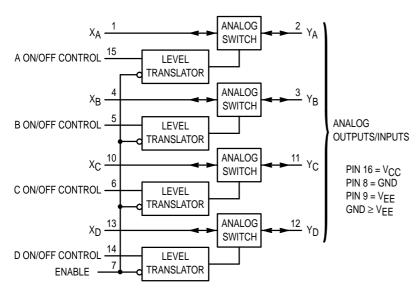

High-Performance Silicon-Gate CMOS

The MC74HC4316 utilizes silicon–gate CMOS technology to achieve fast propagation delays, low ON resistances, and low OFF–channel leakage current. This bilateral switch/multiplexer/demultiplexer controls analog and digital voltages that may vary across the full analog power–supply range (from VCC to VEE).

The HC4316 is similar in function to the metal–gate CMOS MC14016 and MC14066, and to the High–Speed CMOS HC4016 and HC4066. Each device has four independent switches. The device control and Enable inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs. The device has been designed so that the ON resistances (RON) are much more linear over input voltage than RON of metal–gate CMOS analog switches. Logic–level translators are provided so that the On/Off Control and Enable logic–level voltages need only be $\rm V_{GC}$ and GND, while the switch is passing signals ranging between $\rm V_{CC}$ and $\rm V_{EE}$. When the Enable pin (active–low) is high, all four analog switches are turned off.

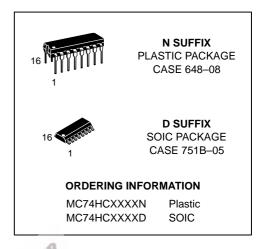

- Logic-Level Translator for On/Off Control and Enable Inputs
- Fast Switching and Propagation Speeds
- High ON/OFF Output Voltage Ratio
- Diode Protection on All Inputs/Outputs
- Analog Power–Supply Voltage Range (VCC VEE) = 2.0 to 12.0 Volts
- Digital (Control) Power–Supply Voltage Range (V_{CC} GND) = 2.0 to 6.0 Volts, Independent of V_{FF}
- Improved Linearity of ON Resistance
- Chip Complexity: 66 FETs or 16.5 Equivalent Gates

MAXIMUM RATINGS*

Symbol	Parameter		Value	Unit
VCC	Positive DC Supply Voltage	(Ref. to GND) (Ref. to VEE)	- 0.5 to + 7.0 - 0.5 to + 14.0	V
VEE	Negative DC Supply Voltage (Ref. to 0	- 7.0 to + 0.5	V	
VIS	Analog Input Voltage		V _{EE} - 0.5 to V _{CC} + 0.5	V
V _{in}	DC Input Voltage (Ref. to GND)		- 1.5 to V _{CC} + 1.5	V
I	DC Current Into or Out of Any Pin		± 25	mA
PD	Power Dissipation in Still Air	Plastic DIP† SOIC Package†	750 500	mW
T _{stg}	Storage Temperature		- 65 to + 150	°C
TL	Lead Temperature, 1 mm from Case for (Plastic DIP or S	260	°C	

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND \leq (V_{in} or V_{out}) \leq V_{CC} .

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open. I/O pins must be connected to a properly terminated line or bus.

SOIC Package: - 7 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the Motorola High-Speed CMOS Data Book (DL129/D).

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
VCC	Positive DC Supply Voltage (Ref. to GND)	2.0	6.0	V
VEE	Negative DC Supply Voltage (Ref. to GND)	-6.0	GND	٧
VIS	Analog Input Voltage	VEE	Vcc	V
V _{in}	Digital Input Voltage (Ref. to GND)	GND	Vcc	V
V _{IO} *	Static or Dynamic Voltage Across Switch	-	1.2	V
TA	Operating Temperature, All Package Types	- 55	+ 125	°C
t _r , t _f		/ 0 / 0 / 0	1000 500 400	ns

^{*} For voltage drops across the switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.

DC ELECTRICAL CHARACTERISTICS Digital Section (Voltages Referenced to GND) VEE = GND Except Where Noted

APPLICATION INFORMATION

The Enable and Control pins should be at V_{CC} or GND logic levels, V_{CC} being recognized as logic high and GND being recognized as a logic low. Unused analog inputs/outputs may be left floating (not connected). However, it is advisable to tie unused analog inputs and outputs to V_{CC} or V_{EE} through a low value resistor. This minimizes crosstalk and feedthrough noise that may be picked up by the unused I/O pins.

The maximum analog voltage swings are determined by the supply voltages V_{CC} and V_{EE}. The positive peak analog voltage should not exceed V_{CC}. Similarly, the negative peak analog voltage should not go below V_{EE}. In the example

below, the difference between V_{CC} and V_{EE} is twelve volts. Therefore, using the configuration in Figure 16, a maximum analog signal of twelve volts peak-to-peak can be controlled.

When voltage transients above V_{CC} and/or below V_{EE} are anticipated on the analog channels, external diodes (Dx) are recommended as shown in Figure 17. These diodes should be small signal, fast turn—on types able to absorb the maximum anticipated current surges during clipping. An alternate method would be to replace the Dx diodes with MO•sorbs (Motorola high current surge protectors). MO•sorbs are fast turn—on devices ideally suited for precise dc protection with no inherent wear out mechanism.
