## LOW-NOISE HIGH-SPEED PRECISION OPERATIONAL AMPLIFIERS

SLOS100B – FEBRUARY 1989 – REVISED AUGUST 1994

- Direct Replacements for PMI and LTC OP27 and OP37 Series

### Features of OP27A, OP27C, OP37A, and OP37C:

- **Maximum Equivalent Input Noise Voltage:**  
3.8 nV/√Hz at 1 kHz  
5.5 nV/√Hz at 10 kHz
- **Very Low Peak-to-Peak Noise Voltage at 0.1 Hz to 10 Hz . . . 80 nV Typ**
- **Low Input Offset Voltage . . . 25 μV Max**
- **High Voltage Amplification . . . 1 V/μV Min**

### Feature of OP37 Series:

- **Minimum Slew Rate . . . 11 V/μs**

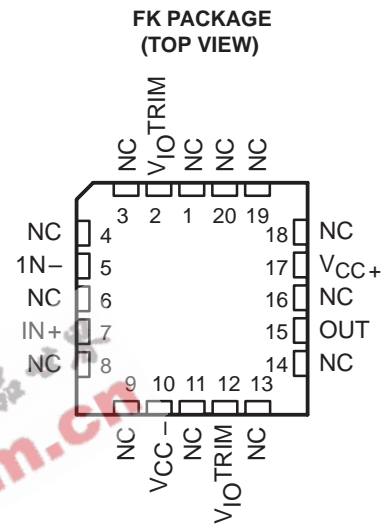

### description

The OP27 and OP37 operational amplifiers combine outstanding noise performance with excellent precision and high-speed specifications. The wideband noise is only 3 nV/√Hz and with the 1/f noise corner at 2.7 Hz, low noise is maintained for all low-frequency applications.

The outstanding characteristics of the OP27 and OP37 make these devices excellent choices for low-noise amplifier applications requiring precision performance and reliability. Additionally, the OP37 is free of latch-up in high-gain, large-capacitive-feedback configurations.

The OP27 series is compensated for unity gain. The OP37 series is decompensated for increased bandwidth and slew rate and is stable down to a gain of 5.

The OP27A, OP27C, OP37A, and OP37C are characterized for operation over the full military temperature range of -55°C to 125°C. The OP27E, OP27G, OP37E, and OP37G are characterized for operation from -25°C to 85°C.

NC – No internal connection

### symbol

Pin numbers are for the JG and P packages.

**LOW-NOISE HIGH-SPEED PRECISION OPERATIONAL AMPLIFIERS**

SLOS100B – FEBRUARY 1989 – REVISED AUGUST 1994

**absolute maximum ratings over operating free-air temperature range (unless otherwise noted)**

Supply voltage, $V_{CC+}$ (see Note 1)	22 V
Supply voltage, $V_{CC-}$ (see Note 1)	– 22 V
Input voltage, $V_I$	$V_{CC\pm}$
Duration of output short circuit	unlimited
Differential input current (see Note 2)	$\pm 25$ mA
Continuous power dissipation	See Dissipation Rating Table
Operating free-air temperature range: OP27A, OP27C, OP37A, OP37C	– 55°C to 125°C
OP27E, OP27G, OP37E, OP37G	– 25°C to 85°C
Storage temperature range	– 65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 60 seconds: JG or FK package	300°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds : P package	260°C

- NOTES: 1. All voltage values are with respect to the midpoint between  $V_{CC+}$  and  $V_{CC-}$  unless otherwise noted.  
2. The inputs are protected by back-to-back diodes. Current-limiting resistors are not used in order to achieve low noise. Excessive input current will flow if a differential input voltage in excess of approximately  $\pm 0.7$  V is applied between the inputs unless some limiting resistance is used.

**DISSIPATION RATING TABLE**

PACKAGE	$T_A \leq 25^\circ\text{C}$	DERATING FACTOR	$T_A = 85^\circ\text{C}$	$T_A = 125^\circ\text{C}$
	POWER RATING	ABOVE $T_A = 25^\circ\text{C}$	POWER RATING	POWER RATING
JG	1050 mW	8.4 mW/°C	546 mW	210 mW
FK	1375 mW	11.0 mW/°C	715 mW	275 mW
P	1000 mW	8.0 mW/°C	520 mW	N/A

APPLICATION INFORMATION

general

The OP27 and OP37 series devices can be inserted directly onto OP07, OP05,  $\mu$ A725, and SE5534 sockets with or without removing external compensation or nulling components. In addition, the OP27 and OP37 can be fitted to  $\mu$ A741 sockets by removing or modifying external nulling components.

noise testing

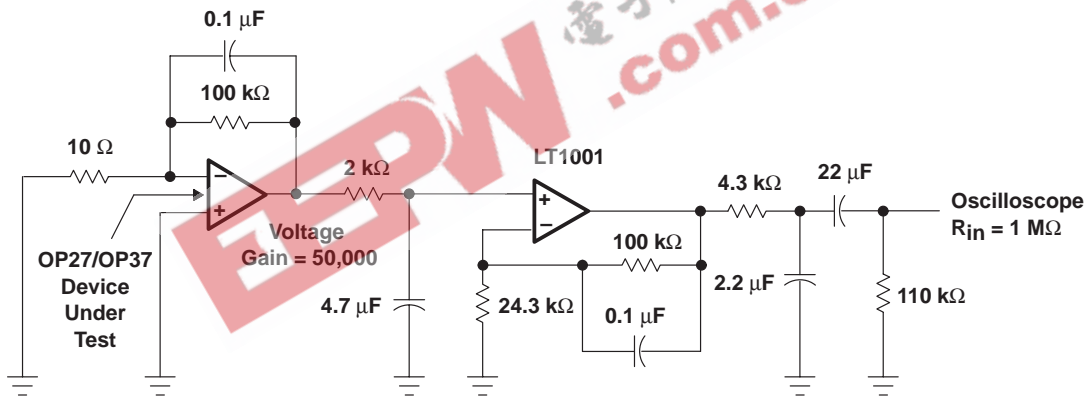

Figure 34 shows a test circuit for 0.1-Hz to 10-Hz peak-to-peak noise measurement of the OP27 and OP37. The frequency response of this noise tester indicates that the 0.1-Hz corner is defined by only one zero. Because the time limit acts as an additional zero to eliminate noise contributions from the frequency band below 0.1 Hz, the test time to measure 0.1-Hz to 10-Hz noise should not exceed 10 seconds.

Measuring the typical 80-nV peak-to-peak noise performance of the OP27 and OP37 requires the following special test precautions:

1. The device should be warmed up for at least five minutes. As the operational amplifier warms up, the offset voltage typically changes 4  $\mu$ V due to the chip temperature increasing from 10°C to 20°C starting from the moment the power supplies are turned on. In the 10-s measurement interval, these temperature-induced effects can easily exceed tens of nanovolts.
2. For similar reasons, the device should be well shielded from air currents to eliminate the possibility of thermoelectric effects in excess of a few nanovolts, which would invalidate the measurements.
3. Sudden motion in the vicinity of the device should be avoided, as it produces a feedthrough effect that increases observed noise.

**APPLICATION INFORMATION**

NOTE: All capacitor values are for nonpolarized capacitors only.

**APPLICATION INFORMATION**

When measuring noise on a large number of units, a noise-voltage density test is recommended. A 10-Hz noise-voltage density measurement correlates well with a 0.1-Hz to 10-Hz peak-to-peak noise reading since both results are determined by the white noise and the location of the 1/f corner frequency.

Figure 35 shows a circuit measuring current noise and the formula for calculating current noise.

**Figure 35. Current Noise Test Circuit and Formula**

**offset voltage adjustment**

The input offset voltage and temperature coefficient of the OP27 and OP37 are permanently trimmed to a low level at wafer testing. However, if further adjustment of  $V_{IO}$  is necessary, using a 10-kΩ nulling potentiometer as shown in Figure 36 does not degrade the temperature coefficient  $\alpha_{V_{IO}}$ . Trimming to a value other than zero creates an  $\alpha_{V_{IO}}$  of  $V_{IO}/300 \mu\text{V}/^\circ\text{C}$ . For example, if  $V_{IO}$  is adjusted to 300  $\mu\text{V}$ , the change in  $\alpha_{V_{IO}}$  is 1  $\mu\text{V}/^\circ\text{C}$ .

The adjustment range with a 10-kΩ potentiometer is approximately  $\pm 2.5 \text{ mV}$ . If a smaller adjustment range is needed, the sensitivity and resolution of the nulling can be improved by using a smaller potentiometer in conjunction with fixed resistors. The example in Figure 37 has an approximate null range of  $\pm 200 \mu\text{V}$ .

**Figure 36. Standard Input Offset Voltage Adjustment**

**Figure 37. Input Offset Voltage Adjustment With Improved Sensitivity**

**offset voltage and drift**

Unless proper care is exercised, thermoelectric effects caused by temperature gradients across dissimilar metals at the contacts to the input terminals can exceed the inherent temperature coefficient  $\alpha_{V_{IO}}$  of the amplifier. Air currents should be minimized, package leads should be short, and the two input leads should be close together and at the same temperature.

## APPLICATION INFORMATION

### offset voltage and drift (continued)

The circuit shown in Figure 38 measures offset voltage. This circuit can also be used as the burn-in configuration for the OP27 and OP37 with the supply voltage increased to 20 V,  $R_1 = R_3 = 10\text{ k}\Omega$ ,  $R_2 = 200\ \Omega$ , and  $A_{VD} = 100$ .

NOTE A: Resistors must have low thermoelectric potential.

**Figure 38. Test Circuit for Offset Voltage and Offset Voltage Temperature Coefficient**

### unity gain buffer applications

The resulting output waveform, when  $R_f \leq 100\ \Omega$  and the input is driven with a fast large-signal pulse ( $> 1\text{ V}$ ), is shown in the pulsed-operation diagram in Figure 39.

**Figure 39. Pulsed Operation**

During the initial (fast-feedthrough-like) portion of the output waveform, the input protection diodes effectively short the output to the input, and a current, limited only by the output short-circuit protection, is drawn by the signal generator. When  $R_f \geq 500\ \Omega$ , the output is capable of handling the current requirements (load current  $\leq 20\text{ mA}$  at  $10\text{ V}$ ), the amplifier stays in its active mode, and a smooth transition occurs. When  $R_f > 2\text{ k}\Omega$ , a pole is created with  $R_f$  and the amplifier's input capacitance, creating additional phase shift and reducing the phase margin. A small capacitor ( $20\text{ pF}$  to  $50\text{ pF}$ ) in parallel with  $R_f$  eliminates this problem.

APPLICATION INFORMATION

NOTE A: If 24 channels are multiplexed per second and the output is required to settle to 0.1 % accuracy, the amplifier's bandwidth cannot be limited to less than 30 Hz. The peak-to-peak noise contribution of the OP27 will still be only  $0.11 \mu\text{V}$ , which is equivalent to an error of only  $0.02^\circ\text{C}$ .

## IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
